Unhappily, the persecutors, whoever they might be, have started their activities again over the last two weeks. Usually they try to blame their activities on their victim, but this time they have stopped even pretending that the persecution is my fault. Their verbal abuse appears as gratuitous as it is vicious.

Last Sunday 14 March, I went for a meal in Londons Chinatown with some friends. As we were walking down Gerrard St, a man shouted loudly, twice, the obscenity which has been directed at me for some three years now. This followed previous incidents where the same words had been used. It is very upsetting to be verbally abused in this way and to know that the cowardly abusers are guaranteed to "get away with it" because if you report it then it will be assumed to be part of your illness.

Keith Hill MP (Labour - Streatham), my elected representative, as ever refuses to help.

MI5 Persecution : How to Identify the Persecutors

Usually delusional thinking does not allow the perpetrators to be identified, or the alleged persecution to be proved. My so-called "delusions" are different, because I have several times over a period of some nine years seen the same people, in widely varying places. Most importantly, their names have been recorded, on aircraft passenger lists and hospital register; and if only the police would do their job conscientiously then the persecutors could be identified and this unhappy story brought to a final conclusion.

BA93 Heathrow->Toronto, 10 June 1993

In 1993 I flew to Toronto for a holiday. On disembarking from the aircraft, a group of four men who travelled together looked in my direction, and one of them said, laughing, "If he tries to run away well find him".

I was absolutely stunned when I heard this. I wasnt surprised that they had followed me to Canada, but it shocked me that they had been on the same flight, and that one of them had foolishly given their group away. Unfortunately I was so stunned that I made no attempt to stop them as they got off the flight and proceeded into the terminal. I did not see these people again during my visit to Toronto. I do not know whether they followed me, or whether they were only part of a larger group, some of whom may have already been on the ground and awaiting my arrival.

Over the next few years I made a number of attempts, all unsuccessful, to obtain the passenger list for this flight. British Airways keeps passenger flight coupons for each flight; so if only the police would do the job that is being asked if them, then these four persecutors could be identified, and thus their employing organisation, which is very likely to be the Security Service, determined.

These four men were, apart from the joker who looked the odd man out in the pack, very serious individuals. They appeared to be in their forties or fifties, and my impression on seeing them was that they might have been former soldiers. Their campaign against me concentrates on how "funny" their abuse is; but in this they are plainly lying, because they realise how awful will be the damage to the establishment of which they form part, if the truth about the persecution ever sees the light of day.

The riddle of "Alan Holdsworth"

During Oct/Nov 1996 I saw a doctor several times about an infection, and on 2 Nov 1996 I went to Emergency at the Ottawa Civic Hospital and saw Dr Worthington, who was then Chief of Emergency Medicine. I had to wait several hours before being seen, and several people jumped ahead of me in the queue. One of these was a grey-haired man in his forties or fifties. This may have been one of the men on the BA flight in 1993; I cannot be sure. When Dr Worthington asked his name, he loudly said, "Tad", which is the common abbreviation of my name. Dr Worthington looked puzzled, glanced at the sheet in front of him, and said, "but your name is Alan Holdsworth isnt it?". (I am pretty sure his Christian name was Alan; I cannot be sure of the surname). The man looked put out, and said quietly, "yes".

Unfortunately, I did not follow up this incident immediately. Some time later, I wrote to Dr Worthington to ask the name of this patient, but he refused to give the name out.

I saw this person again two and a half years later, at Ottawa Airport, just as I was about to leave for England. In the warm weather, he was wearing a coat and woolly cap, and pacing up and down in a menacing and aggressive manner. Presumably he thought he was pretending to be a "nutter" and in this way was getting at me; my impression is that he doesnt need to pretend, Holdsworth or whatever his name is is clearly a psychopath and in a healthy society such a person would be locked up, instead of being paid public money to exercise his psychopathic instincts. But todays Britain, a country where the MI5 secret police are given free rein and nobody dares raise a voice in protest, is not a healthy society.

"He doesnt know who we are"

For some reason, whenever I take a British Airways flight, I get hassled by the "persecutors who wont admit theyre MI5". Since this business started, I have travelled BA three times; once in June 1993 BA93 (see above), once to/from Europe during Dec 95/Jan 96, and once in June 1998 with my mother to visit her family. The last journey, I was abused by two "plants" who kept repeating, loudly, "paranoid" (I have this recorded on minidisc). Presumably British Airways gives MI5 the seating plans for their flights, which allows MI5 to position their agents of abuse three rows behind me, so I cant face them, and they are throwing abuse at the back of my head. I have travelled BA as infrequently as possible; to Canada, I usually travel Air Canada.

Anyway, lets return to the second of the three BA trips, and in particular to the flight on 2 January 1996 from Berlin Tegel, to Heathrow, and onwards to Montreal Mirabel. Id waited all night at Tegel for the flight, and was very tired on reaching Heathrow. On the plane to Montreal, two youths sat about three/four rows behind me and to the right, in the window seats. One of them, a rather fat "asshole" to use the Americanism (it fits), kept on going on about "this bloke", saying among many other things, "he doesnt know who we are".

Now that form of words is particularly interesting, because from May 1995, some 8 months previously, I had been vigorously denouncing the "MI5 Persecution" on Usenet. So if Id guessed wrong, then you might expect the harassers to crow about it; which they have not done. If I had guessed right, and the persecutors have been silent before and since this flight, then they could either admit they were MI5, which would be a very serious thing for them to own up to, or they could brazenly lie, in which case I would report their lie, and since many people must surely know who they are, they would lose all credibility. So they have remained silent; apart from this one phrase on the BA flight, where one of their agents said, "he doesnt know who we are". Note carefully that this phrase is NOT a denial, it only appears to be a denial; since it does not say that my guess was wrong; it only states the objective fact that I do not know the identity of the persecutors, without giving any information as to the validity of my guess. Which leads me to posit that my guess was correct.

MI5 Persecution Update: Friday 25 March, 1999

If You Intend To Reply, Please Read This
Please.... keep your response to one page if you can!. Faxes over a page or two will be deleted without being read.

The Usual Words

The persecutors-who-wont-admit-theyre-MI5 have been active again this week. On Saturday 20/3/99 I visited Ravenscourt Park in west London, and was verbally assaulted with the usual words, "something wrong with him". This audio file is on the web at URL;

This afternoon (Friday 26/March) I was again verbally assaulted while travelling by bus. The same sexual obscenity was thrown at me, and the incident was recorded on my minidisc-walkman. Because of the deeply offensive nature of the slander, I will not be posting this on the website.

Keith Hill MP (Labour - Streatham), my elected representative, as ever refuses to help.

MI5 Persecution : Browse Website

The March 1998 issue (number 42) of .net Magazine reviews the website describing it as an "excellent site". Since August 11, 1996 over 50,000 people have browsed this website.

You are encouraged to read the web pages which include

a FAQ (frequently asked questions) section outlining the nature of the persecutors, their methods of harassment through the media, people at work and among the general public

an evidence section, which carries audio and video clips of media and workplace harassment, rated according to how directly I think they refer to me

objective descriptions of the state security agencies involved scanned texts of the complaints I have made to media and state security agencies involved

posts which have been made to netnews over the last four years on this topic

This article outlines what is to be found on the webpages, which you are encouraged to browse for the complete story.

Frequently Asked Questions

Your excursion through the website starts with the "FAQ - Frequently Asked Questions" portion. MI5s campaign of harassment against me has been going on for almost 9 years, and its longevity and breadth is reflected in the FAQ. Many thousands of people in Britain and abroad, including some recipients of this fax, have known for many years of MI5s activities against me. The FAQ describes the mass "Omerta suppressing its publication"; we pretend Britain is part of the "Free World", yet the British Secret Police, which is what MI5 are, carry on for many years a campaign which politicians and the media know about, and rely on the silent complicity of so many thousands of people.

The FAQs introductory article names those who are "in the know"; media figures like Martyn Lewis, Michael Buerk, entertainment figures like Chris Tarrant, politicians and many in the general public, "all united in a conspiracy which breaks the laws which the UK does have regarding harassment, and all completely uncaring for any semblance of decency or elementary respect for individual rights.

Broadcast media play a key role in the harassment. The very first incident in June 1990 was when a television newsreader reacted to what she saw happen in my living room at home; such incidents of "interactive television" are still happening in 1999. The same goes for radio stations such as Capital FM. In spring 1994, Chris Tarrant on his Capital morning show made an aside to someone else in the studio, about a person he didn't identify. He said, "You know this bloke? He says we're trying to kill him. We should be done for attempted manslaughter". Tarrant and Capital have made strenuous efforts to avoid answering this charge.

Perhaps worst of all, MI5 have deliberately set-up many incidents in public places such as tube stations, shops, cinemas, where they have paid people to throw abuse at me. Since MI5 obtains funds to the tune of 160 million a year to fund its criminal activities, it has funds both to pay its operatives and to "buy" media figures and members of the public to take part in its campaign of persecution.

The Security Service are professional liars. They throw slanderous abuse, yet they refuse to admit out loud that they are doing so. When challenged about their activities through the Security Service Tribunal they lie and deny their activities. They induce other workers and managers at places of employment to take part in their campaign of abuse, presumably by buying them in the same way they buy media figures.

Complaints, and Press Coverage (BBC Lies, MI5 Lies)

As you might expect I have challenged both the Security Service, through the Security Service Tribunal, and offending broadcasters, to own up to what they have been doing. And as you might also expect, all of these people have lied through their teeth. Still worse, they have refused to commit unambiguous lies on paper; they have couched their lies in bureaucratic language, and allowed others to make false assurances and tell lies on their behalf. So when their lies are exposed, they will then tell further Clintonesque lies about how they werent really telling lies in the first place!

On 6/Feb/1997 the BBC told me they would "never engage in any form of surveillance activity such as you describe". The BBC told me Buerk and Lewis had refused to put their lies in writing, but had stated verbal falsehoods denying my accusations of "interactive watching" during news broadcasts. Clearly Buerk and Lewis fear being caught and exposed, so they hide behind their Viewer Correspondence department.

In March 1997 I issued a summons against the BBC to try to "smoke them out". This summons was struck out as "disclosing no reasonable cause of action", because I had acted as a Litigant-in-Person and most LiP summons are treated thus. My case was arguable in law, so the striking out was unjust.

In June 1997 the Security Service Tribunal wrote to me regarding the complaint I had brought against MI5 in February. They say, "The Security Service Tribunal have now investigated your complaint and have asked me to inform you that no determination in your favour has been made on your complaint." I think you can guess the contempt which I feel for the Security Service Tribunal, who have never made a determination against MI5, and act as merely a whitewashing body for the Security Service. Unsurprisingly in May 1997 the Interception of Communications Tribunal gave the same result.

The last few items of "Press Coverage" give details of mentions of the MI5 Persecution in various magazines and newspapers such as BBCs Ariel, the Observer and .net magazine.

Evidence

Some audio and video clips of evidence have been recorded. My weakness in this area is because most of the really unambiguous evidence would have been obtainable in 1990-92, but I wasnt taping anything at the time, and its very difficult to now obtain recordings from that period.

The audio clip "Life is so Hard" relates to harassment at my workplace in Canada. In the latter half of 1996, I was sitting near to co-worker Mark Lee, who kept coming out with words and phrases which showed MI5 were supplying him with data from my home life. For example, I would say something on the telephone at home, and the following day he would repeat verbatim what I had said. When Mark Lee saw I was recording what he was saying, he started to make his remarks more ambiguous, or make the obvious ones out of earshot of the recorder.

However, during the evening of 12 November 1996, at home in my apartment (flat to you UK-ers), I said "life is so hard, and then you die". A nihilistic, negative thing to say, but quite distinctive. The following day, 13 November, Mark said loudly, "life is so hard eh, and then you die" followed by loud laughter. I captured this on my tape-walkman and the computer-audio file is posted on the website.

There are a number of other audio files in the websites "Evidence" area demonstrating the abuse to which MI5 subject me to through their paid agents.

Also in this section is a very interesting article by journalist Bernard Levin, which followed a meeting I had with a friend in 1991, and to my mind describes in some details Levins "artists impression" of the meeting. He talks about a "madman" who "bursts into tears, and swears it is all true. And it is."

Internet Newsgroup (Usenet) archive

From May 1995 until the present day, this matter has been discussed exhaustively on internet newsgroups. The most interesting articles from the first two years of posts are documented here. This area is worth reading since most of the questions which the reader would ask, have been asked at some time or another by someone on usenet. Perhaps the very first article posted sums it all up so succinctly;

Date: Thu May 4 18:27:24 1995
Newsgroups: alt.conspiracy
Subject: BBC's Hidden Shame

Remember the two-way televisions in George Orwell's 1984? The ones which watched you back? Which you could never get rid of, only the sound could be turned down?
Well the country which brought Orwell into the world has made his nightmare follow into the world after him. Since 1990 the British have been waging war against one of their own citizens using surveillance to invade privacy and a campaign of abuse in the transmitted media in their efforts to humiliate their victim.
And the most remarkable thing about it is that what they do is not even illegal - the UK has no laws to protect the privacy of its citizens, nor does it proscribe harassment or abuse except in the case of racial abuse.
A lot of people in England know this to be going on, yet so far they have maintained perfect "omerta"; not a sound, not a squeak has escaped into the English press, and for all the covert harassment absolutely nothing has come out into the public domain.
Have the British gone mad? I think we should be told.

So how much deeper will the persecutors-who-wont-admit-theyre-MI5 sink in their campaign of lies and intimidation? Each time I thought they could sink no lower, they have managed to surprise me. You thought it could never happen here? When the MI5 British Secret Police make their smears against me, it is the corruption of the Establishment, which they are part of, that is demonstrated.

MI5 Persecution Update: Friday 16 April, 1999

If You Intend To Reply, Please Read This
Please.... keep your response to one page!. Faxes over a page or two will be deleted without being read.

BBC newscaster Nicholas Witchell cant stop himself laughing

During 1990-91 there were very many instances of "interactive television" where newscasters and other TV presenters saw on a screen before them what was happening in my home, and reacted, frequently by laughing at me. During this period I unfortunately did not record these programmes. For the last year or two, I have been recording everything I watch, and there has been a drastic decrease in such incidents.

However, on occasion, television presenters do still engage in "interactive watching" and react to what they see. This has been evident with Jon Snow of Channel Four News recently - a particularly interesting case, since it has been established that he cannot be corrupted by money (it is well-documented that MI5 offered him a tax-free salary and he turned them down). I wonder what device MI5 are using to encourage him to do the "interactive watching"?

On Saturday 10 April 1999 at 7pm, Nicholas Witchell on BBC2 News reacted when he saw that I was watching the programme, and I have his reactions stored safely on videotape. I have watched this tape several times and I am entirely confident that my evaluation of his reactions is correct. For several minutes his upper lip quivered in mirth as he attempted to keep a straight face. Then finally his self-control evaporated through the excuse of a weak joke and his face collapsed into a grin.

The strange thing is that I dont know why he was laughing at me, what I had done recently to "deserve" to be laughed at. The MI5 persecutors usually manage to invent some justification as to why people should laugh at and/or abuse me ("hes an X", "it was so funny" etc), so Mr Witchell could have been laughing for any number of reasons. Perhaps he found the views I have been expressing in these articles amusing? I suppose if youre paid enough money and ordered to laugh then even the most innocuous thing becomes funny.

Jon Snow of Channel Four News cant stop himself smirking, either.

On 12 February 1999 I was watching Channel Four News presented by Jon Snow. As usual, I was recording the programme, so that if anything out of the ordinary happened, Id be able to go back and watch it again.

Now, Jon Snow, by his own claim, is uncorruptible. He says he turned down an offer of a substantial tax-free salary from MI5 - they wanted to make him their mouthpiece, and he told them where to get off.

So you will be most surprised to learn that Jon Snow "interactively watched" me that evening, and on many other evenings. Approximately fifteen minutes into the programme, he announced that the US President would be making a live appearance at about 7.30pm; I looked at the clock on the mantelpiece; and Snow saw me looking at the clock, and visibly tried to suppress a smirk.

Uncorruptible, are you, Mister Snow? If not money, then why are you watching me, Mister Snow? Are they forcing you to watch me? Cant you turn the monitor off, Mister Snow?

Keith Hill MP (Labour - Streatham), my elected representative, as ever refuses to help.

Comparing the MI5 Persecution with German "Final Solution"

It might seem offensive to compare the mass murder of millions of civilians in wartime with the peacetime persecution of merely one person. Yet the comparison has been coursing through my mind for several years now, because the brutality of German intent to "sub-humans" is very much comparable to the brutality of British intent to someone they vituperate and term "not up to British standards". The methods may differ, but the persecutors mindset is the same.

The Germans first targeted the mentally disabled, too

During WW2 millions of ethnic Russians, Poles, Jews, mentally ill, gypsies and other minorities were rounded up and murdered in purpose-built camps by the German regime, in the name of "racial superiority". Fifty years on, the British Secret Police, MI5, instituted a campaign of mass hysteria; but in their cowardice, limited their activities to one single victim.

It is instructive to note that the early German "cleansing" effort was directed primarily not at Jews, but at the mentally ill. The Nazis set up the T4 project in the thirties to "cleanse" away 70,000 mentally disabled people, including schizophrenics and epileptics. After WW2 the Jews with their media influence used the reaction from the holocaust to roll back anti-semitism in the Western countries; however, the mentally ill are today still a persecuted group in the modern Western world as they were under the Nazis (the current Jewish home secretary in the UK intends to bring in laws for incarceration without any criminal charge for some mentally ill people - he protects his own minority, but does nothing for the other minorities in todays society), and this continuing bias forms a central cause for the current acts of persecution in the UK.

Widespread knowledge of what is happening to the "un-British" minority

In both the German persecution of the thirties and early forties, and the current British persecution, many, many people are well aware of whats happening. There is widespread complicity through inaction of populace; and in a substantial proportion of the mainstread population, the persecution had/has widespread enthusiastic support; yet in both the German case in the 1940s and the British today, the existence of persecution is a mass secret which must be never admitted out loud. In the recent Lawrence case this "secret bigotry" has been termed "institutionalised racism", and that is a very good word for what the British are doing today The persecutory attitudes and omerta regarding them are so deeply ingrained in the national psyche that they define the national mood

During WW2 many Germans knew minorities were disappearing, and through inaction quietly condoned their government's mass murder of "un-German" minorities and inferior "foreigners"; and in the 1990s, similarly, many English people know what the MI5 British Secret Police have been doing, and not only condone it, but actively take part, because of xenophobia against the "un-British" unit minority that is the target of "British" actions. This attitude by the British persecutors has been made explicit through the words "he's not up to British standards"; the British seem to have found their very own "untermenschen" to victimise.

Why these obsessive "holy wars" happen

This type of aggression occurs when the majority is threatened or humiliated in some way, economically, militarily or culturally. In pre-WW2 Germany the threat was primarily economic and military, following Germany's humiliating defeat in the first world war and the reparations it was forced to pay. In modern Britain, one might guess that the majority English who are behind the persecution feel pressured by the swiftly diminishing status of Britain in the world, and the rapidly increasing coloured colonisation of their country, which in time will see the ethnic English a minority in their own land, and their more antisocial elements, unable to reply to the obvious threat, instead project their aggression onto another, weaker, unit minority

In both cases there is a whiff of "holy war" or irrational obsession with the persecution. Certainly the German behaviour fifty years ago bordered on the not-quite-sane, and the current British behaviour towards their chosen victim is strongly tinged with a leave-taking of reason. And the choices open to the victims are the same, since MI5 will never allow me to escape them, "if he tries to run away we'll find him", just like the commandant of Auschwitz telling the new arrivals, "the only escape is through the chimney".

The Victim Will Destroy Us if We Dont Destroy Him First

The persecutors propaganda is the same. Fifty years ago the Germans said, "if we don't do it to the Jews then the Jews will do it to us"; and MI5's propaganda in the early nineties concentrated on their victim as a "monster" aesome "untermenschen" minority.

"We are decent fellows" say the Brutal Persecutors

During the course of researching this article I read part of the very interesting book, "Hitler - A Study in Tyranny", by Alan Bullock. This volume contains a quote from Himmler on the "Final Solution";

"Most of you know what it means when a hundred corpses are lying side by side, or five hundred or one thousand. To have stuck it out, and at the same time .... to have remained decent fellows, that is what has made us hard. This is a page of glory in our history which has never been written and is never to be written."

In the MI5 persecution, too, there is a thread of deliberate brutality to the sick and vulnerable, while the persecutors maintain that "we are decent fellows". There is almost a conscious schizophrenia in the self-attitudes of the Security Service operatives and those in the public who they employ against me, which reflects the contradiction evident in the German attitude above. On the one hand, they stoop to the lowest and most base behaviour; yet at the same time, the MI5 operatives tell themselves that since they are civilised British people, then surely they must by definition be "decent fellows". Any indecency is made the fault of the victim; "hes making us persecute him, so we need feel no guilt".

Yet the conduct is atypical of the way these peoples see their normal modes of behaviour. Befslaughter was not typical of normal German behaviour up to that point. Similarly, the current MI5 abuse goes against the grain of British self-image as being "reserved" and "decent", since they are using terms of abuse which are common among blacks and other supposedly less-developed races, but not among the English.

Conclusion

The ultimate aim of both persecutions is the humiliation and physical extinction of the persecuted group. The Germans did this in a very direct way; the British Secret Police MI5 are acting indirectly and relying on self-extinction of their target, because in peacetime and in the current somewhat false climate of "political correctness" more direct methods are impossible. If MI5 undertook more direct action the mass "omerta" would be broken.

I have written this article with sincerity to show how a historically recent persecution in another country parallels what is being done in this country today. In both cases, the evil-doers are of their countries establishments, and rely on widespread tacit support to maintain the persecution and omerta around it. While the holocaust was undoubtedly the greater evil, it is important to be aware of the fact that had the Germans not been defeated fifty years ago, their plans would have gone through to total completion. In Britain today no force threatens the "permanent government" of which the Security Service forms a part; and it looks very unlikely that the wrongs perpetrated by the MI5 secret police will ever be revealed to public view, and the British secret state brought to justice for its evil actions.

MI5 Persecution Update: Friday 30 April, 1999

If You Intend To Reply, Please Read This

Please.... keep your response to one page!. Faxes over a page or two will be deleted without being read.

Somewhere between 0 and 100%

The last few days there have been no clear recordable instances of abuse. However, while travelling on the Underground, while walking around near my home and going to friends homes, I am constantly troubled by thoughts that those people over there might be about to get at me; that the couple sitting in the opposite seats laughing are in fact laughing at me; et cetera, et cetera.

A comment by a scientist to the BSE inquiry sticks in my mind. He described the possible scale of the epidemic as "between 0% and 100%". It might not be happening, it might not happen at all, to any discernable degree.... or it might be total. Without clear recording, which seems to have become impossible the last couple of weeks, there is no way of knowing whether the harassment really is continuing, whether we have entered a temporary hiatus, or whether perhaps it has perhaps stopped for now.

But for the time being I think there arent any reasons to dicontinue these faxes. I only re-started them six weeks ago in response to a resumption of MI5 harassment; and I think I will need to be more convinced of absence of persecution before I discontinue my complaints.

The Newscasters are still watching

In the last few weeks there have been at least a couple of fairly overt instances of "interactive watching" by newscasters. I reported this in a previous "MI5 Persecution Update".

These instances are really very rare compared to 1990-91, when there were many dozens of such occurrences. Undoubtedly the reduction is due to my practice of videotaping everything I see. Recently I had the opportunity of showing this years "happenings" (Jon Snow/Nicholas Witchell) to my psychiatrist, and he agreed that in both cases the newscasters were expressing merriment without visible cause, and that objectively it might be possible for my claims to be true - although of course other people reported similar thoughts to him, and this thinking is usually a symptom of illness.

Read About the MI5 Persecution on the World Wide Web

The March 1998 issue (number 42) of .net Magazine reviews the website describing it as an "excellent site". Since August 11, 1996 over 50,000 people have browsed this website.

You are encouraged to read the web pages which include

a FAQ (frequently asked questions) section outlining the nature of the persecutors, their methods of harassment through the media, people at work and among the general public

an evidence section, which carries audio and video clips of media and workplace harassment, rated according to how directly I think they refer to me

objective descriptions of the state security agencies involved

scanned texts of the complaints I have made to media and state security agencies involved

posts which have been made to netnews over the last four years on this topic

Keith Hill MP (Labour - Streatham), my elected representative, as ever refuses to help.

MI5 Waste Taxpayer Millions on Pointless Hate-Campaign

Recently I was talking to an independent observer about the nature and purpose of the perceived campaign of persecution against me. The person I spoke to, a highly intelligent man, said he was struck by the utter pointlessness of the perceived campaign against me. He also said that, if my theories were in fact true, many people would have to be involved, in the surveillance itself, and in the technical side of the delivery of information from my home to TV studios for example, if the "interactive watching" were happening as described. He voiced these thoughts without any prompting from me; but both I and other observers had arrived at pretty much the same conclusions, some years ago.

I saw a team of four men at Toronto Airport in 1993

To carry out the surveillance alone, full-time, would employ four or five men, or their equivalent in terms of man-hours. Each man would "work" an eight-hour shift, so you would need at least three men doing the surveillance, plus a connecting link / manager. An indicator that this estimate is correct arrived in 1993, when I was accosted by one of a group of four men at Toronto Airport; he said, laughing, "if he tries to run away well find him". Plainly these were the men who had been involved in the intrusive surveillance of me for the preceding three years.

On other occasions, I have seen the same man on two or three occasions. On one such occasion, at Ottawas Civic Hospital in November 1996; he gave his name to the doctor as "Alan Holdsworth" or some such; my hearing is not very good sometimes and I am not sure of the surname, although I am sure "Alan" was his first name. I saw exactly the same man again in Ottawa, at the airport, in July 1998. Obviously, other people must be "working" with this person; he would not be the sole agent employed in this case.

Usenet readers views on the Cost to MI5 of Running the Campaign

Here's what a couple of other people on internet newsgroups / Usenet (uk.misc) had to say regarding the cost of running such an operation...

PO: >Have some sense, grow up and smell reality. What you are talking about
PO: >would take loads of planning, tens of thousands of pounds and lots of
PO: >people involved in the planning, execution and maintenance of it. You
PO: >must have a very high opinion of yourself to think you are worth it.

and......

PM: >But why? And why you? Do you realize how much it would cost to keep
PM: >one person under continuous surveillance for five years? Think about
PM: >all the man/hours. Say they _just_ allocated a two man team and a
PM: >supervisor. OK., Supervisor's salary, say, #30,000 a year. Two men,
PM: >#20,000 a year each. But they'd need to work in shifts -- so it would
PM: >be six men at #20,000 (which with on-costs would work out at more
like
PM: >#30,000 to the employer.)
PM: >
PM: >So, we're talking #30,000 x 6. #180,000. plus say, #40,000 for the
PM: >supervisor. #220,000. Then you've got the hardware involved. And
PM: >any transcription that needs doing. You don't think the 'Big Boss'
PM: >would listen to hours and hours of tapes, do you.
PM: >
PM: >So, all in all, you couldn't actually do the job for much less than
PM: >a quarter million a year. Over five years. What are you doing that makes
PM: >it worth the while of the state to spend over one and a quarter million
PM: >on you?

Those are pretty much the sort of calculations that went through my head once I stopped to consider what it must be costing them to run this operation. At the very least, a quarter million a year - and probably much more, given the intrusive and human-resource-intensive methods employed. Times nine years. Equals well over two million pounds - and probably much, much more.

Its wasteful for someone with my skills to be unemployed

The wastefulness of the MI5 campaign against me is not just that of futile expenditure on their side. It is also extremely wasteful for someone with my talents to be unemployed and on a disability pension. I am highly qualified in numerate disciplines, yet am unable to work, specifically because of the MI5 hate-campaign against me. It is a terrible waste of resources for a supposedly efficient economy like that of the UK to be squandering the talents of a skilled and capable worker.

I made every effort to remain in employment for as long as I could, but ultimately I was defeated by MI5s employment of massive resources specifically targeted on my workplaces with the sole aim of seeing me evicted from those workplaces. You might expect this sort of behaviour from the Stasi or some other secret police force in a communist country where labour is cheap, and the governments aim on seeing its citizens confined; but for a supposedly free and efficient economy like Britains, the wastefulness resulting both directly and indirectly from the Security Services activities is simply criminal, and should never be allowed.

The international dimension means the costs are multiplied many times overoer had any sense, then they have surely taken leave of them over the last nine years.

Four years of persecution in Canada

The persecution re-started within less than five minutes of my arrival in Canada, as documented above, and in the "frequently asked questions" article on the website. The words, "if he tries to run away well find him" spoken by one of the harassers at Toronto Airport are now imprinted on my mind.

A year later I emigrated to Canada, intending to find a job and settle there, hoping that MI5s interest in me might dim with time. I did manage to find work there, but my hopes of avoiding Security Service interest were ground into dust. As detailed above, I saw the same man in November 1996 and July 1998, both times in Ottawa. Apart from these encounters, there were numerous incidents between 1994 and 1998 of harassment, of an identical nature and in most cases using identical words to what had occurred in the UK. It became quite clear to me that the permanent surveillance and harassment operation which MI5 had subjected me to in England was being continued.

For a team of four or five men to be employed overseas must cost a lot more than if they operate in their home country. And for MI5 to continue the operation for a period of over four years, continuously, must cost many hundreds of thousands of pounds. This confirms my belief that the state is funding the campaign against mehat the Security Service receives current annual funding of #160M. Divided by 1850 staff, works out at #86,000. But the unit annual cost of each "watcher" must be much higher than this, especially given the frequently mobile and overseas nature of their actions of the last few years. A very conservative figure might be a little over #100,000 pa for each of a team of five people, or half a million pounds per year. For nine years, so far. So the most conservative estimate of the surveillance element alone is perhaps four or five million pounds since 1990.

This guesstimate is of course theoretical - I am not privy to inside details of how MI5 split their funding. But to take some other examples, the cost of a US counter-surveillance specialist per day is USD 5,000. Even if the agents permanently assigned to me are not of this calibre - even if they employ specialists when difficult work planting bugs etc is encountered - their salary and support costs must still be very high. The individual agents are doing well for themselves as they are well-paid to exercise psychopathic instincts which in any sane society would see them in prison; but the taxpayers who must fund this terribly wasteful exercise are being "done" out of hundreds of thousands of pounds each year.

It must be emphasised that the above estimates are highly conservative. Besides the surveillance operation, it must carry a high cost in man-hours to propagate covert slanders through the population; to setup and maintain the "interactive watching" links to TV and radio stations, which these organisations continue desparately to "lie and deny"; and to induce antipathy in co-workers which would not otherwise exist.

Why they are wasting Millions of Pounds on a "Nobody from South London"

As remarked in the prologue to this article, it is really most extraordinary that the Security Service spends a chunk of its budget, every year for nine years so far, on a meaningless campaign against a "nobody from South London". That they are spending such a large amount of money has been confirmed to me on several occasions, usually by oblique references to "its costing this country millions". The supposed "logic" behind the persecution is that MI5 wish to avoid their harassment of me, and the involvement of the UK media, to be made public; yet as the reader will appreciate that is a circular argument, "theyre doing it because they want to keep it secret and avoid humiliation for themselves and their country" begs the question, "why did they start doing it in the first place?", to which in truth I myself do not know the answer.

Plainly MI5 with its rich budget can afford half a million pounds a year to waste on a "nobody from South London". Some time ago I was talking to a British surveillance professional on Compuserve who told me "this work costs a lot of money and is usally because the person I am following has done something (usually criminal) to warrant all this money and time being spent." Yet in this particular case it is plainly not the "victims fault" that the harassment is taking place. The hate-campaign against me is completely the creation of the obsessive psychologies of the MI5 agents who have made themselves my persecutors; it is obviously a "personal" campaign for them, and for years they misuse taxpayer funding to feed their insane, unnatural and fixated fantasies.

Four Years of "MI5 Persecution" Posts on Internet Newsgroups

For approximately the first three years of the MI5 persecution, from June 1990 until late 1992, I kept as quiet as possible, in the hope that by not reacting, MI5s interest in me would decrease and they would simply go away of their own accord. This is the sort of behaviour some people employ against bullies; if the bullies arent getting a reaction, then they might simply go away and victimize someone else.

Unfortunately, this tactic didnt work. The quieter I became, the more shrill and hysterical the noise from the Security Service operatives. For about two years I didnt watch TV news at all. Yet this only heightened their obsessed fixation; they continued to follow me wherever I went, they continued to induce harassment at work by managers and fellow workers, and they continued to encourage me to commit suicide. They seemed to regard my refusal to react as a crime which they would have to "put right" by ever more extreme forms of abuse.

Finally, in 1995, I changed tactics radically. Since late 1994 I had had accounts with internet providers in Ontario, Canada. I discovered the cornucopia of internet newsgroups, on every topic from consumer electronics, to politics and legal topics, and I discovered online services such as Compuserve and AOL. In May 1995, I made the first posting to the conspiracy newsgroup, on the subject of "BBCs Hidden Shame".

BBC's Hidden Shame

The internet newsgroup discussion, which has now reached its fourth anniversary, started with an article in alt.conspiracy, which I reproduce here.

Date: Thu May 4 18:27:24 1995
Newsgroups: alt.conspiracy
Subject: BBC's Hidden Shame

Remember the two-way televisions in George Orwell's 1984? The ones which watched you back? Which you could never get rid of, only the sound could be turned down?

Well the country which brought Orwell into the world has made his nightmare follow into the world after him. Since 1990 the British have been waging war against one of their own citizens using surveillance to invade privacy and a campaign of abuse in the transmitted media in their efforts to humiliate their "victim".

And the most remarkable thing about it is that what they do is not even illegal - the UK has no laws to protect the privacy of its citizens, nor does it proscribe harassment or abuse except in the case of racial abuse.

A lot of people in England know this to be going on, yet so far they have maintained perfect "omerta"; not a sound, not a squeak has escaped into the English press, and for all the covert harassment absolutely nothing has come out into the public domain.

Have the British gone mad? I think we should be told

At this point, I did not name MI5 as my persecutors. I was still unsure that they were the ones responsible for the "psychological terrorism". In followup posts however I did name them; and the persecutors have never denied the claim; so I think my guess is valid. (The Security Service Tribunal in 1997 have said "no determination in your favour was made", but it is a well established fact that MI5 lies routinely to the Tribunal which has never found in favour of a plaintiff, so no conclusions can be drawn from this.)

This first post was made to alt.conspiracy, but further posts were made to the UK-local newsgroups, in particular uk.misc but also uk.legal and uk.politics (which is now called uk.politics.misc). Some time ago I tried to take the battle to the Compuserve forums, UKPOLITICS (which is now called UKCURRENT - current affairs), but my articles were censored by the forum operators. Such censorship is impossible on the internet newsgroups.

Police Refuse to Act

I have complained several times to the Metropolitan Police, who have each time refused to help.

From: Green <Green@guidion.demon.co.uk>
Newsgroups: uk.misc,uk.politics,alt.politics.british,soc.culture.british
Subject: Re: MI5 Persecution: Why Aren't the British Police Doing Their Job?
Reply-To: Green@guidion.demon.co.uk
Date: Sun Apr 7 21:13:30 1996

In article <DpIE0r.736.0.bloor@torfree.net>
bu765@torfree.net "Mike Corley" writes:

>Last Easter (1995) I went into the local police station in London and spoke to
>an officer about the harassment against me. But I couldn't provide tangible
>evidence; what people said, in many cases years ago, is beyond proof, and
>without something to support my statements I cannot expect a police officer to
>take the complaint seriously.

This in itself dos not suggest that the police have it in for you. The old bill operates on extremely tight spending limits forced on them by that pillock Michael Howard, and without evidence, they often have higher priorities than chasing something that cannot go to court.

I doubt that the police are actually being leant on, but they probably realise that if they looked into this, they would be leant on hard. The met always stays away from anything that looks like it has Defence, Security or secret service interest already, because they realise that they are below these government agencies in the general pecking order.

If I walked into my local nick and complained that MI5 were snooping on me, they would show me the door without even looking at my evidence, because that bored desk seargant with only five years to go before he retires doesn't want to start fucking about with somebody who has incurred the wrath of Stella Rimington. He would rather deal with the lost dogs and driving licence producers, eat his cheese and pickle sandwiches and piss off home at the end of his shift than have some high ranking spook having a go at his boss and getting him a bollocking.

In short, you have earned much sympathy but little surprise. Just remember that saying about the enemy of your enemies.

Most recently, I wrote in March 1999 to Charing Cross Police Station CID. They did not acknowledge or reply to my letter. When I phoned them up, the detective Id written to treated me to a sadly not unusual display of police bigotry, with an uneducated rant about "your paranoid rubbish".

It would be nice to think that such uneducated bigotry is something other than wholly typical of police behaviour, but unfortunately that is an illusion that is rapidly dispelled.

Uncorruptible Jon Snow of Channel Four News

From previous articles the reader will know what I think Jon Snow has recently been watching me while he reads Channel Four News in the evening. Recently I digitized a few moments of one such broadcast, where his face twists into a smile, without there being anything in the news broadcast to cause merriment. Here is a usenet post from some time ago on MI5s "bought and paid for" tools in the so-called "free" press.

Peter Harding (harding@ermine.ox.ac.uk) wrote:
: I was at speakers' corner on Sunday. There was one chap who was bellowing
: about something or other, I don't know what, but one thing he said to
: someone caught my ear:

: "BBC, MI5, same thing."

Can't disagree with that sentiment.

Wasn't it documented that MI5 sometimes "bought" journalists and broadcasters? I remember reading a report by some jouralist who had been offered an extra tax-free income by MI5 to become their covert mouthpiece, and had refused.

....

> : >mouthpiece, and had refused.
> :
> : It was Jon Snow of Channel 4.
>
> Was it reported in any of the papers?

It has been reported several times. The most recent was in Private Eye, a few months back. As I recall they also wanted information from him; journalists would be a natural choice for members of the Security Service and the Secret Intelligence Service for information sources.

> It might be interesting to see what he had to say regarding their

> attempt to recruit him.

He was most concerned that many others would have accepted such an offer. However, we can probably make an educated guess as to some of those who accepted: Nigel West (Rupert Allason, MP) and Chapman Pincher would come near to the top of the list.

Corrupt Security Service agents steal millions from taxpayers

Money is of course a factor in the grand equation which is the MI5 persecution. It costs money for the Security Service to "buy" people in the media etc. But that is only a small part of their expenditure of taxpayers resources. Most of the expenditure is directly on the salaries if the agents involved; and in this post I put forward the theory that MI5 are trying to draw out their involvement for as long as possible, very cynically, to maximise their income and line their own pockets.

At each stage they have tried to pretend that I am something out of the ordinary. Either I was very stupid ("he's an idiot") or very clever ("he's like a genius"). Either I was a threat to Western civilization (Levin once referred to me as the next Hitler) or I was completely defenceless ("a soft toy").

Now, it should be obvious to any person with common-sense that I am not out of the ordinary in any way. I have an IQ which is average for the Web, I am racially white European, and there are plenty of other people with schizophrenia or epilepsy out there who haven't been targeted for MI5 attention, so why me?

I think the answer is that the MI5 agents who harass me have cynically exploited the situation by painting me as extraordinary in order to assure themselves of well-paid employment funded by the ordinary British taxpayer. To put it bluntly, they are stealing millions of pounds from the taxpayer to feed their own pockets.

This assertion is supported by the observation that it's the same agents who are doing the harassment. Six months ago in a local hospital I was harassed by someone whose face I had seen (he had stared straight at me aggressively, at the time I just thought it was some nutter but it turns out he was one of "them") aboard a KLM flight a couple of years ago. It's presumably been the same people most of the time. I've seen the way contractors act when they don't want their positions terminated. Would these agents really want to lose their well-paid employment harassing me? Presumably they are promising their bosses a "breakthrough" (ie my demise) real-soon-now and have been for the last seven years, while all the while these MI5 agents skim millions off the taxpayer.

I wouldn't mind a job like that. Perhaps if I persecute myself a little bit, like standing in front of a mirror and shouting mindless obscenities, do you reckon I'd get a slice of the caky Service Tribunal. This year Nick Brooks, current Tribunal Secretary, confirmed to me that he could not think of a single case where the Tribunal had found in favour of a complainant. Here is my usenet post from two years ago.

Subject: MI5: "It wasn't us"
Newsgroups: uk.misc,uk.legal
Organization: Toronto Free-Net

"The Security Service Tribunal have now investigated your complaint and have asked me to inform you that no determination in your favour has been made on your complaint."

Signed ER Wilson, Tribunal Secretary

Well that's a relief then. All that spamming for nothing eh. Gaw blimey, if they say they're not doing it then it can't be them, can it?

In a recent letter to Mr Brooks I expressed the opinion that the Tribunal were unable to fulfil their responsibilities in the face of MI5 falsehoods. Nevertheless, I do intend to make another complaint to the Tribunal in the near future, despite the Tribunal appearing to be a toothless watchdog.

Discrimination against a Unit Minority

MI5 have been very clear in their instructions as to what I should do. They have openly shouted at me the word "suicide", and also from the other abuse it is clear that they want my existence terminated.

This point is covered in more detail in a previous article. The following post describes the xenophobic nature of MI5s campaign against me. They have refined their bigotry down to a unit minority, yet they make use of the discrimination against the mentally ill which is a feature of current British society.

>Indeed. If you've ever had a 'conversation' with someone suffering
>from florid schizophrenia, you'll know how difficult it can be to
>'argue' with them.

I don't have florid symptoms. But I'm in a difficult situation, because those people who don't know, aren't going to believe, and those who do, they just go along with the crowd. It's never a good idea to go against the grain, and the grain here is defined by interests in the establishment and the media. Even people who could say out loud what was happening won't, because then there's a risk that they'll be seen as traitors and ostracised.

Usually this type of 'hidden abuse' is racial and targetted at a racial minority within a country. You keep the minorities out of the good jobs, but you don't admit discrimination exists. It happens everywhere, not just in Britain. The persecution that is going on now is in reality a refined form of racism. Instead of "nigger" it's "nutter", and abusing the mentally ill is still socially acceptable today. In 50 years it might not be, but today there isn't any social or legal sanction against it.

So really they've refined racial harassment down to a minority of one. The words may be different, but the methods are the same.

MI5 Persecution: BBC Newscasters Lie & Deny They're Watching Me

Central to the persecution campaign waged against me for some nine years now by the Security Service is their use of the media, and in particular the broadcast media, to make clear to me that I am under surveillance and being watched within my own home, even by BBC newscasters while they read the news. This is really an act of arrogance; MI5 and their tools in the television and radio are so sure that they can never be caught, that they have many times made explicity clear on broadcast programmes that they are as capable of seeing me as I am of seeing the broadcast pictures. Even when they have known I am taping the programmes they still carry on this practice; for examples of TVand radio presenters caught "in action", see the Evidence area of my website.

If you wish to reply to this article......
then please include your name and fax number! I provide the means for recipients to send me their thoughts on the topics discussed, but ask that you provide me with your fax number or email address if you require a response. Also would you please send not more than one or two pages, if by fax. Thank-you!

It started with a Newscaster, and it continues with Newscasters today

The very first incident in the story started with a reaction by an ITN newscaster, Sue Carpenter, in June of 1990, almost nine years ago now. She reacted to what she saw in my living room at home as she read the news. My mother had brought an apple for me into the room, whereupon the newsreader smirked and giggled, apparently finding this funny. I couldn't believe what I was seeing. I carried on watching news and other television programmes to see if presenters would show signs of "interactive watching"; to my surprise, this happened again and again. Unfortunately, I did not have my wits sufficiently about me to videotape these programmes, and it is now almost impossible to obtain recordings dating back to 1990.

However, I have been busy recording everything Ive watched the last couple of years, and the taping has yielded some nuggets, which you will find if you point your Web browser at the "evidence" area of my website, whose URL address is given above. Strangely it is not particularly the BBC who are "after me" at the moment (with the exception of occasional fire from Nicholas Witchell), but that supposed paragon of virtue and decency Jon

Snow of Channel Four TV News (he actually works for ITN), who once claimed hed turned down MI5s offer of a tax-free salary. I will cover Snows recent actions in a future article.

BBCs Hidden Shame

The first ever Usenet post (internet newsgroup article) on the subject of the MI5 bugging / BBC watching occurred, as stated in a previous article, in early May 1995. It is reproduced here;

Date: Thu May 4 18:27:24 1995
Newsgroups: alt.conspiracy
Subject: BBC's Hidden Shame

Remember the two-way televisions in George Orwell's 1984? The ones which watched you back? Which you could never get rid of, only the sound could be turned down?

Well the country which brought Orwell into the world has made his nightmare follow into the world after him. Since 1990 the British have been waging war against one of their own citizens using surveillance to invade privacy and a campaign of abuse in the transmitted media in their efforts to humiliate their "victim".

I suppose "BBCs Hidden Shame" is more of a wish than a fact. It may be hidden, but the BBC and other media and security organisations seem to have no shame whatever in their anti-social, not to say criminal, actions. Nor do the general public, who seem quite happy to parrot the vilest obscenities without much hesitation or apparently thought.

Martyn Lewis, Nicholas Witchell and the rest

Most of the harassment occurred in 1990-92, when I wasnt making any recordings, and the BBC wont release copies of current affairs programmes from that period.... so although I can remember there were many incidents in that time, even many specifics, I cant dig up the actual programmes to flesh out the bones.

This year, there has been at least one incident with Nicholas Witchell as newsreader, which I have successfully recorded and digitized, i.e. converted into a computer Quicktime movie file. This has not yet found its way onto my website (Im a busy man, dontcha know) but you can be sure I will let the readership of these articles know when that clip makes it onto the web. The Witchell clip was recorded on Saturday 10 April 1999 at 7pm, and shows Witchell trying to restrain his features from collapsing into a smirk. First his upper lip quivers for several minutes, then with the non-excuse of a non-joke his entire face twists into a grin. It looks as if he finds me so funny, that he allows himself to submerge any pretence at professionalism in a sea of MI5-inspired sarcasm and harassment.

The two BBC newscasters whose reactions to me I can remember most vividly over the years are Martyn Lewis and Nicholas Witchell. I can remember thinking years ago that Michael Buerk was also seeing me at home; and if the other two are watching then there would be no reason why he wouldnt be doing the same; but in all honesty I cannot remember a single clear instance of his reacting through facial or verbal expression to me.

I can remember several instances of Martyn Lewis reacting to what he saw of me, however. In early 1992 I was watching the BBC news with Lewis on a small black-and-white portable TV at my then home in Oxford. I threw a term of abuse at Lewis; he flinched, then gave a grin and made a comment from which I understood that he had been on my side, but might have changed his mind as a result of what Id just said to him.

And in spring 1991 I remember Martyn Lewis clearly reacting to what he saw of me at my then accommodation in Woking, Surrey, by continuing to stare at some fixed point near the camera after the news had finished - presumably this is where the monitor interactively showing pictures of my room was located.

Why would BBC and other Newscasters Watch and Harass Me, Watching Them?

This is a very difficult question, and I dont actually know the answer. It is a matter of record that the Secret Services are very much part of the Establishment. The recent exposure of the "MI6 Agent List" on the internet, and its coverage in the newspapers, reveals how much MI5 and MI6 are recruited from the ranks of the Establishment. Obviously the relationship is bi-directional; the Establishment influences MI5/MI6, but the secret services (well, perhaps not so secret now we know who works for MI6!!!) also influence the machinery of power and information dissemination i.e. media in this country. So they must have a lot of covert leverage with the BBC and ITN.

Some of this leverage is obviously through bribery. It is a matter of record that MI5 tried some years ago to "buy" Jon Snow of Channel Four TV. He turned them down - obviously they must have approached other media people as well, and from the lack of other reports of people turning them down, it may be presumed that some other journalists will have accepted the sugared carrots put before them. Ironically, Jon Snow has been taking part in the recent "watching" actions against me - but why he has allowed himself to be used by the secret services is something which I do not know.

Perhaps the Security Service uses blackmail to twist arms of journalists into co-operating with them? I have always thought there was something slightly odd about Martyn Lewiss demeanour. At the time of the Ron Davies "rough trade" scandal it was reported that MI5 had known all about Davies predilections and the sham of his pretence to be a happily married man. Perhaps MI5 have been able to dig something up from Martyn Lewiss private life to blackmail him into acting on their behalf? And if there wasnt anything before the "newscaster watching" started then there most certainly is something now.... once theyve started watching, the newscasters will surely wish their activities to remain covered-up, and co-operate with the security service.

"Newscaster Watching" Deliberately Constructed to Mimic Schizophrenia

Presumably this is the first case in history of television journalists actually taking part in acts of real-time, live spying and reacting against one of their viewers. What you have to understand, though, is that I was quite mentally healthy in June 1990, certainly relative to November 1992, when after two and a half years of harassment I was finally admitted to hospital as an out-patient. MI5 decided from the outset that they would make me mad; they constructed the media harassment to resemble what would be reported by a person with mental illness; and then they carried on years of abuse to inflict on me the condition which they wished to use as an excuse to cover up their abuses.

I sold my portable TV in autumn 1990 and stopped watching television regularly. I realise now that this may have been a mistake. What I should have done was to watch TV and listen to the radio, but tape-record everything and make a note of what each excerpt meant to me. I would then be in a much stronger position as regards to evidence that I am now. That is what I am trying to do now, but unsurprisingly the TV/radio presenters have stopped getting at me, now they know they are being recorded.

When I started publicising my case on internet newsgroups in 1995, I was met with the disbelief one might expect to be accorded to a mentally ill person who talks about "newscaster watching" and media persecution. Some newsgroup participants thought I had started a "troll", an invention made to obtain a reaction; one bright spark even suggested a group of psychology students were behind the articles. But most people thought the articles were symptomatic of derangement - and that is exactly what MI5 want people to think. MI5 chose me as a target because I was mildly mentally ill at the outset in 1990, although I stress my illness then was very mild in comparison with November 1992, and because they knew that enough abuse would (a) make me much more seriously ill, and (b) once I was more ill, they would "get away" with a harassment deliberately constructed to look like the symptoms of paranoid schizophrenia.

Martyn Lewis Denies & Lies, But Wont in Writing

In February 1997 I wrote to BBC Viewer & Listener Correspondence and asked them to investigate the claim that their newscasters had engaged in "real-time spying" on me. They replied that they had asked Martyn Lewis and Michael Buerk whether they had engaged in such practices, and that they had both made verbal denials to VLC, but were refusing to put their denials in writing.

To me it looks as if Lewis and Buerk are happy to lie verbally but not in writing, because written falsehoods would place them unambiguously in the wrong, whereas they can try to talk their way out of verbal lies if they are ever caught, or perhaps even deny the verbal lies completely? If they lie without shame, then why would they have any shame about future lies about lying?

BBC-VLC also said that the BBC "would never engage in any form of surveillance activity" such as that described. Clearly Martyn Lewis and the rest have lied to their own organisations personnel about their criminal actions. So much for the "objective", "truthful" BBC, a nest of shabby liars.

Summons against the BBC, for Nuisance caused by Newscaster Spying

In March 1997 I issued a civil summons against the BBC, seeking injunction against further "newscaster spying", and token damages for what the BBC had done to me until that date. The purpose of the summons was to try to "smoke out" the BBC, since obviously I did not have good evidence which would be necessary for either a civil or criminal case to be made against them. My summons was worded as follows;

1. The plaintiff is and was at all material times residing at [home address]. At some time prior to or during June 1990, persons of unknown identity entered Plaintiff's premises and installed concealed television equipment in said premises.

2. A campaign of harassment was launched against the Plaintiff by the persons of unknown identity, which in part took the form of instigating harassment by BBC TV newscasters (including specifically Michael Buerk and Martyn Lewis) as they read news bulletins, by making direct and personal comments to Plaintiff.

3. The campaigns purpose was to subject Plaintiff to great mental stress and induce mental breakdown. As a result of it Plaintiff did indeed suffer from severe mental strain in 1990-97.

4. In order to avoid the mental strain being caused to him the Plaintiff has been compelled to stop watching BBC TV news. Defendant therefore committed the tort of private nuisance, since normal use of home was interfered with.

5. Plaintiff claims a permanent injunction prohibiting further nuisance, and damages for nuisance suffered limited to 5,000.

Naturally, my attempt to smoke-out the BBC and its lying newscasters failed. The BBCs litigation department sought to have my summons struck out; and they succeeded in doing so, on the grounds of my action "disclosing no reasonable cause of action". I was also prevented from issuing further civil claims against the BBC without leave of the Court. Apparently litigants-in-person frequently / usually have their claims struck out with this wording, regardless of the merit of their claims.

BBC Suppresses my Claims of "Watching by Newscasters"

BBCs staff magazine Ariel ran my advert "BBC Newsreaders Spying on my home" for one issue in the Personal category on 8/July/1997 before it was spotted and axed by editor Robin Reynolds; please see webpage; http://www.pair.com/spook/evidence/plaint/ariel.htm
Clearly the BBC will not allow claims of its wrongdoing to be made public in the media channels it controls.

On several occasions people said to my face that harassment from the TV was happening. On the first day I worked in Oxford, I spent the evening in the local pub the Rose and Crown with the company's technical director Ian, and Phil, another employee. Ian made a few references to me and said to Phil, as if in an aside, "Is he the bloke who's been on TV?" to which Phil replied, "Yes, I think so".

The reader might think that mere "watching" by newscasters etc might be a relatively benign happening. But it is not; it is part of MI5s framework of harassment and lies. On many occasions the reactions of the BBCs newscasters to me has been in the nature of sarcasm, implicit contempt and abuse. This is visible in Witchells news programme mentioned above, where he engages in abuse by laughing at me during his newsreading. It was particularly visible in the early period of 1990-92, and as late as Autumn 1993, when during a Newsnight broadcast Jeremy Paxman interviewed a football person about soccer hooliganism, and the interviewee gave vent to an unsubtle rant about "theyre idiots, theyre just idiots, keep up the surveillance". Paxman started grinning, showing he understood and was taking part in the abuse being perpetrated on that programme.

Conclusion

The MI5 Persecution started with harassment by television newscasters, and today harassment by TV and radio presenters still forms a key part of MI5s activities against me. When this business started in June 1990 I was in relatively good health of mind. Years of persecution by the secret police and their mouthpieces in the state-run BBC and other media eroded my health until MI5 achieved their aim of seeing me rendered mentally ill in November 1992. The diagnosis which was forced on me unfortunately and ironically meant that my reports of the harassment are disregarded, because the mentally ill are second-class citizens in todays Britain.

Yet TV and radio harassment continues, albeit in a reduced form, despite my taping all the programmes I watch, resulting in my being able to obtain and demonstrate objectively on the website instances of media presenters attacking me. Unfortunately these recorded instances are quite tenuous; I might understand them, the presenters understand what it is theyre doing, but despite many thousands of people knowing the truth of the "newscaster watching", the omerta continues and they continue to refuse to admit the truth of the matter. It is a terrible indictment of British society that there is not even one decent person willing to speak out. I look forward to the day when the truth does finally emerge, and the mass corruption which has allowed the MI5 persecution to take place is finally purged and the Establishment criminals caught and appropriately punished.

MI5 Persecution: Molestation during Travel

MI5s persecution of me varies in intensity. Since 1990 it has been steady for perhaps 80% of the time; there was a notable quiet period in 1993, and another quiet period in Jan-Feb 1995, as well as a hiatus in the first two months of 1999. It puzzles me that they cease and restart, seemingly without any logic or reason. But one aspect of MI5s activities against me which is relatively predictable is this weeks articles topic, which is Molestation during Travel. Almost every time I cross the Atlantic, go to the Continent or even try to enjoy a holiday in this country, you can bet that MI5 will be there doing their utmost to wreck it all.

This aspect of the harassment is particularly relevant as I will be travelling to Europe again in a months time, with naturally the Minidisc recorder in tow; so it will be interesting to see if I can record the abuse which will almost certainly take place, either on the Tube going to the airport, at the airport, on the flight, in the terminal building - MI5 have previously instituted instances of abuse at each of these locations, so well see how much taxpayers money they waste this time, and whether it will prove possible to capture their abuse on minidisc.

Read about the MI5 Persecution on the Web

June 1992 in Polands mountain resort of Zakopane

The persecution started in June 1990, and for the first two years I stayed in the UK apart from a couple of brief day trips to Calais. By the summer of 1992 Id had enough of being cooped up in England with abusive fellow employees egged on by an abusive secret police service, and decided to spend 10 days in southern Poland, on what was intended to be a holiday at the mountain resort town of Zakopane.

Unfortunately the psychopaths of the Security Service were not willing to allow me to enjoy a holiday in peace and quiet. The journey to Zakopane was by coach from the meeting point at Londons Victoria coach station (National Express) followed by ferry followed by another coach across Europe. As we left Victoria a youth and his girlfriend started a loud tirade of abuse directed at "this bloke", where the "bloke" was never named, but it was very clear that the "bloke" was myself. The youth said "they" had "found somebody from his school, and he was always really stressed at school, a real psycho". Again, the label "they" was not elaborated on, but it was clear that "they" = the persecutors from MI5. The boy also said, "he was in a bed and breakfast for only one night and they got him". By a not unexpected coincidence I had been in a B&B in Oxford a week previously, which had been booked from work; other things lead me to the conclusion that the company's offices were bugged for most of the 2 1/2 years that I was there, so "they" would have known a room in the B&B had been booked. After a few minutes of this I went back to where they were sitting and asked where they were travelling. The boy named a village in France, and the girl's giggling suddenly ceased; presumably it permeated to her brain cell what the purpose of the boy's abuse was.

It is now very clear to me that MI5 were trying to have me incarcerated, assaulted or killed on this trip across Europe. The degree of verbal violence inescapably leads to this conclusion. When we arrived at our destination, it became clear that many people, both in our tour group and its guide, and among the ordinary residents of the town, knew there was a movement under way to "get" me. MI5 employed many people and significant resources for an action which they knew would only take a maximum of ten days. A commercial operation would never have felt able to waste such resources on such an unproductive and temporary action; only a state-sponsored, taxpayer-funded entity like the Security Service would be able to be so wasteful.

To give some examples of what happened in those ten days; I was walking in some woods outside the town, when a Polish woman, looking at me, said the English "shit" in a strongly Polish-accented voice. For the first three years 1990-92 MI5 had been trying to force this word on me. Another example; I was walking near my "hotel" when a mother said laughing to her child, "a wiesz ze to prawdziwy wariat" which means "you know hes a real madman". And the "TV reacting" happened there too; on Polish TV, a bemused looking journalist said to another, "to jest sprawa Anglikow", which means "its the concern of the English", in other words, none of our business, despite what the English are trying to force down our throats.

Just before we left for home, I went with some others from our group to a nearby bar. There a man shouted at me the same sexual obscenity which MI5 have constantly thrown at me these last three years. I think MI5 try to justify their various terms of abuse by repeating them at me until I say them, either while conscious or while talking in my sleep; and then they seize on my saying those words to "prove" that the obscenities are "my fault", et cetera. This rather stupid reasoning of theirs can actually be seen as indicative of the psychopathic condition attributed to them in a previous article; blaming the victim for the crime you inflict on him is how psychopaths think.

Nor did the persecutors let up during the return trip. Returning on the ferry over the channel, a rather insalubrious-looking guy talked to his mates about "and you know this bloke, hes really mad you know, hes really mad". On the National Express return coach to London, a group of five or six young people started shouting at me. I slumped in my seat and tried to avoid presenting a target, so they got ever more strident - "whats the matter with you, cant you hear us?" One of the other people who had been on the trip to Poland asked them why they were shouting at me, and they said, "hes been to Cambridge", to which the co-holidayer asked them, "have you been to Cambridge?" presumably thinking they were aggrieved fellow students, but they answered "no". Even after I left the coach at Elephant and Castle abuse continued; in the tube station, two kids started throwing abuse at me; one of them said to the other, "and you know he works?" to which the other answered "yes".

Immediate Aftermath of November 1992

As you will know from previous articles, my manager at OCG - ARIS/Oxford, Mr Mitchell, induced a mental breakdown in me in the months leading up to Nov/92. The diagnosis was regarded by the persecutors as a victory for them, because few if any people give credence to allegations of harassment when they are made by somebody suffering from schizophrenia. There is also a bias against the mentally ill, an "institutionalised bigotry" in society comparable to the institutionalised racism against blacks.

However, MI5 did not let up on persecuting me following Nov/92. In December 1992 I flew by charter jet to Alicante in Spain for two weeks recuperation. MI5 planted one of their people on the flight, a youth who tried to start some noises that "hes a nutter". One of the other passengers replied, "oh hes a nutter is he? oh well!" and the youth shut up and said nothing for the rest of the flight. I think it would be fair to say that the youth on the flight was embarrassed by what he had been asked to do in making the flight "uncomfortable" for me; he sounded defensive rather than aggressive.

My first trip to Canada in June 1993

Ive already covered this in a previous article so Ill just give a brief summary here. On 10 June 1993 I flew British Airways from Heathrow to Torontos Pearson Airport. On de-planing from the aircraft, one of a group of four fellow passengers looked at me and said, laughing, "if he tries to run away well find him". It was quite obvious that these four men were the ones who had been harassing me since 1990.

I did nothing to apprehend them or bring this incident to the attention of the airport authorities, mostly because this was my very first visit to Canada, and the last thing I wanted was to get into a dispute before I had even finished disembarking. In retrospect, I can see this was a terrible mistake; I should have made every effort to detain and identify these people.

Subsequently I have made numerous attempts to obtain the names of these people from British Airways passenger lists, by talking to BA, through a lawyer in Ontario, through a solicitor in England, through the UK police, and also through private detectives in the UK. But all my efforts have come to nothing. BA have told me they keep passenger lists for a period of seven years, so they will still have the list for this 1993 flight. I did not see or hear anything during the rest of my visit to Ontario in 1993 which would have lead me to believe that I was being watched or followed.

Journey across Canada in summer 1994

As I think Ive already said in previous articles I emigrated to Canada in late May 1994. For six weeks between late May 1994 and early July 1994 I travelled across Canada from coast to coast, starting in Toronto, visiting various cities and ending up in British Columbia. I saw this both as something of a holiday, and the chance to get to know a little better my adopted country.

As you can guess, MI5 followed me everywhere I went during these six weeks. In Toronto, where I started this trip in late May, I was spoken about by one youth to another with the words "hes an idiot", to which the other replied, laughing sympathetically, "good luck to him".

A couple of days later I went to Montreal and stayed at the YMCA downtown. As you can guess (this is all so predictable, isnt it?) MI5 followed me there and bugged my room at the YMCA. Not only that, but they managed to set-up an instance of "newscaster reaction" from a local television station; while I was watching a Vermont TV news programme on the set in my room, the woman reporter said, "well theyre just tired and they want to go home", which sounds like a pretty unprofessional thing to say until you realise she was trying to say of me that I was the one that was supposed to be tired, and they (ie MI5) wanted me to go home to the UK.

On the bus journey across the North American continent, it was quite clear that MI5 were following me every step on the way. For the first part of the journey they actually put someone on the bus with me, a youth who said at me "that guys paranoid" and tried to incite other passengers to attack me. I stopped for a couple of days in Winnipeg in central Canada, and on leaving the town heard on the radio a female presenter ranting about "insanity! insanity!". It is very tiring travelling such a long distance by bus; I took the journey in two steps, each of about 36 hours; and it is especially tiring when you know MI5 are watching you and harassing you every step of the way.

When I finally got to Vancouver, MI5 instituted the usual harassment, in very short order. I was surprised how quickly they were able to induce hatred towards me in elements of the general populace; the Security Service must have employed a number of agents and serious resources in a very short period of time; and for no real gain, because I havent been back to BC for almost five years, so all their "work" appears to be for nothing. In downtown Vancouver a street person said in front of me, "theyre all talking about him". For a few days I was staying at Pauls Guest House (345 W.14th Ave); on the day I left, the owner Paul shouted at no-one in particular, "hes going to Victoria" - which was quite accurate, I was indeed going to the provincial capital Victoria on Vancouver Island. But I had not told anyone at the guest house where I was going; I had only mentioned to my parents back in England on the phone that I was going away from Vancouver for a few days. Which leads me to suppose that MI5s bugging of the phone in my parents house yielded the "intelligence" that I intended to visit Victoria, and they had passed the information on to Paul.

When I got to Victoria it was again obvious that the persecutors were "doing their stuff" there as well. On the street I was identified as being English, although I had not said anything so my accent hadnt given me away; and returning by ferry to the mainland, I was abused by a Canadian woman who said, "hes a nutter! you can run but you cant hide". During my years in Canada I have never heard the word "nutter" on any other occasion; I do not think it is part of Canadians vocabulary; so the Canadian woman on the ferry, who was obviously talking about me, must have been supplied with this word by the English persecutors. And once I got back to Vancouver, staying at the Austin Hotel on Granville St, I listened to a conversation in the apartment block directly opposite, and a man saying, "hes paranoid, so thats as bad as it can be, so why are they doing this to him?".

Holiday in the States, August 1995

By 1995 I was living in Canada, and in August I went down the eastern seaboard to Florida and as far as Key West by car. As you can guess (this is all so boring and predictable, isnt it?) MI5 followed me every step of the way. I can see in retrospect that this must have been quite easy for them as they had my car bugged, both on the inside to listen to anything that was said and what radio station I was listening to, as well as what must have been a tracker device installed to track it across long distances.

The first city I visited was Philadelphia. In the old Congress Hall where the first US Congress assembled, the woman guide started referring to my situation, saying that "all these people in Europe were watching it", and they were "a little paranoid" at this 18th-century experiment in democracy. Also I had recently written a newsgroup post where Id described a (female) poster as "wet-nosed" (implying "canine"), and a young girl in Philadelphia remarked, "so he thinks were dogs?" There were two or three more incidents during this holiday in the eastern States, including a radio station down near Miami, showing "they" had tracked me all the way there, and were bugging the inside of my car; but I didnt record the details and Ive forgotten some of it now. Also down in Miami Beach a French tourist in a lift expressed support for me with the words, "cest incroyable" ie. its incredible, meaning that MI5s well-known actions against me were beyond belief.

To go back a bit, in about May/June 1995 Id visited New York, again by car, and was insulted several times by people using the same words that had been used against me in England. In Central Park, and elderly Englishman (not a real gentleman - but then the Engish view of themselves as "gentlemen" etc is quite laughable) looked at me and said "idiot". And while I was eating in a streetside restaurant a New York youth started laughing and said something like, "I cant believe it, hes actually here" - I think that was because I had had an expressed wish to visit New York for some years before this, although after this visit I wont be going there again for a very long time.

Visit to Poland December 1995/January 1996

In December 1995 I flew (BA again, unfortunately - every time Ive flown BA one of these incidents has happened, presumably MI5 is happier setting up harassment on British-domiciled carrier) from Montreal to Berlin and travelled on to Poland to visit family. MI5 naturally harassed me in Poland during my brief stay. They followed me around and got Polish people to take part in the harassment. In one case two Polish youths talked in front of me saying in English (with marked Polish accents), "fucked up men, fuck you". There were also other incidents which I dont remember too clearly since it was some time ago.

The return flight connected through Heathrow, and in the transit lounge MI5 again set-up harassment against me. In Poland they were talking their abuse in English, and in London they set Polish people after me to speak in Polish; they heard me on the phone to my father, and said "a wiesz ze to Polski wariat", in an almost sympathetic, inclusive fashion (translation. "you know hes a Polish nutter"). Once on the flight to Montreal I was again set upon by two English youths, one of whom spoke and the other listened. The aggressive "fat bastard" youth said, "if he wants to be a wanker" (its my fault theyre harassing me, you see), self-justification that "hes a nutter" (so we have to keep on abusing him, because hes ill), as well as talking about the town in Poland where I had been staying. He also said, "he doesnt know who we are", but as already remarked in a previous article, that was at best a half-denial of my guess expressed in internet newsgroups that the people after me were MI5 - if anything its a half-confirmation rather than a half-denial.

These incidents are still going on. You can hear digitised audio files of abuse on a BA flight to Berlin in 1998 on the Web at address

On this flight they were again attacking my mental health; "paranoid, hes paranoid" and "nutter" are discernable. The last "during travel" contact was at Ottawa Airport on 21 July 1998, when "Alan Holdsworth" the psychopath MI5 agent, dressed as a vagrant, was pacing aggressively in the departure area. In three weeks I will again be travelling to Europe; we will see what fresh acts of molestation MI5 perpetrate during this trip.

MI5 are Afraid to Admit They're Behind the Persecution

MI5 have issued a formal denial of any involvement in my life to the Security Service Tribunal, as you might expect them to; but, more importantly, the persecutors have never denied that theyre from the Security Service, despite several years of accusations from my corner on usenet and in faxed articles. I am not surprised that the Security Service Tribunal found "no determination in your favour". I am however a little surprised that the persecutors have refused to confirm my identification of them; by doing so, they implicitly admit that my guess was right.

"No determination in your favour" says the Security Service Tribunal

In 1997, I made a complaint to the Security Service Tribunal, giving only the bare outlines of my case. I do not think it would have made very much difference if Id made a much more detailed complaint, since the Tribunal has no ability to perform investigatory functions. It can only ask MI5 if they have an interest in a subject, to which MI5 are of course free to be "economical with the truth". A couple of months after my complaint the Tribunal replied that;

The Security Service Tribunal have now investigated your complaint and have asked me to inform you that no determination in your favour has been made on your complaint.

Needless to say this reply didnt surprise me in the slightest. It is a well established fact that the secret service are a den of liars and the Tribunal a toothless watchdog, so to see them conforming to these stereotypes might be disappointing but unsurprising.

It is noteworthy that the Tribunal never gives the plaintiff information on whether the "no determination in your favour" is because MI5 claims to have no interest in him, or whether they claim their interest is "justified". In the 1997 report of the Security Service Commissioner he writes that "The ambiguity of the terms in which the notification of the Tribunals decision is expressed is intentional", since a less ambiguous answer would indicate to the plaintiff whether he were indeed under MI5 surveillance. But I note that the ambiguity also allows MI5 to get away with lying to the question of their interest in me; they can claim to the Tribunal that they have no interest, but at a future date, when it becomes clear that they did indeed place me under surveillance and harassment, they can claim their interest was "justified" - and the Tribunal will presumably not admit that in their previous reply MI5 claimed to have no interest.

"He doesnt know who we are"

In early January 1996 I flew on a British Airways jet from London to Montreal; also present on the plane, about three or four rows behind me, were two young men, one of them fat and voluble, the other silent. It was quite clear that these two had been planted on the aircraft to "wind me up". The fat youth described the town in Poland where I had spent Christmas, and made some unpleasant personal slurs against me. Most interestingly, he said the words, "he doesnt know who we are".

Now I find this particular form of words very interesting, because while it is not a clear admission, it is only a half-hearted attempt at denial of my guess that "they" = "MI5". Had my guess been wrong, the fat youth would surely have said so more clearly. What he was trying to do was to half-deny something he knew to be true, and he was limited to making statements which he knew to be not false; so he made a lukewarm denial which on the face of it means nothing, but in fact acts as a confirmation of my guess of who "they" are.

On one of the other occasions when I saw the persecutors in person, on the

BA flight to Toronto in June 1993, one of the group of four men said, "if he tries to run away well find him". But the other three stayed totally quiet and avoided eye contact. They did so to avoid being apprehended and identified - since if they were identified, their employers would have been revealed, and it would become known that it was the secret services who were behind the persecution.

Why are MI5 So Afraid to admit their involvement?

If you think about it, what has been going on in Britain for the last nine years is simply beyond belief. The British declare themselves to be "decent" by definition, so when they engage in indecent activities such as the persecution of a mentally ill person, their decency "because were British" is still in the forefront of their minds, and a process of mental doublethink kicks in, where their antisocial and indecent activities are blamed on the victim "because its his fault were persecuting him", and their self-regard and self-image of decency remains untarnished. As remarked in another article some time ago, this process is basically the same as a large number of Germans employed fifty years ago against Slavic "untermenschen" and the Jewish "threat" - the Germans declared, "Germans are known to be decent and the minorities are at fault for what we do to them" - so they were able to retain the view of themselves as being "decent".

Now suppose this entire episode had happened in some other country. The British have a poor view of the French, so lets say it had all happened in France. Suppose there was a Frenchman, of non-French extraction, who was targeted by the French internal security apparatus, for the dubious amusement of French television newscasters, and tortured for 9 years with various sexual and other verbal abuse and taunts of "suicide". Suppose this all came out into the open. Naturally, the French authorities would try hard to place the blame on their victim - and in their own country, through the same state-controlled media which the authorities employ as instruments of torture, their view might prevail - but what on earth would people overseas make of their actions? Where would their "decency" be then?

This is why MI5 are so afraid to admit theyre behind the persecution. Because if they did admit responsibility, then they would be admitting that there was an action against me - and if the truth came out, then the walls would come tumbling down. And if the persecutors were to admit they were from MI5, then you can be sure I would report the fact; and the persecutors support would fall away, among the mass media as well as among the general public. When I started identifying MI5 as the persecutors in 1995 and 1996 there was a sharp reduction in media harassment, since people read my internet newsgroup posts and knew I was telling the truth. The persecutors cannot deny my claim that theyre MI5, because then I would report their denial and they would be seen as liars - but they cannot admit it either, as that would puncture their campaign against me. So they are forced to maintain a ridiculous silence on the issue of their identity, in the face of vociferous accusations on internet newsgroups and faxed articles.

Have MI5 lied to the Home Secretary?

In order for the Security Services to bug my home, they would either have needed a warrant from the Home Secretary, or they might have instituted the bugging without a warrant. Personally I think it is more likely that they didnt apply for a warrant - I cannot see any Home Secretary giving MI5 authority to bug a residence to allow television newscasters to satisfy their rather voyeuristic needs vis-a-vis one of their audience. But it is possible that the Security Service presented a warrant in some form before a home secretary at some point in the last nine years, for telephone tapping or surveillance of my residence, or interception of postal service.

So the possibility presents itself that a Home Secretary might have signed a warrant presented to him based on MI5 lies. Just as MI5 lie to the Security Service Tribunal, so they might have lied to a Home Secretray himself. MI5 and MI6 are naturally secretive services former home secretary Roy Jenkins said, they have a "secretive atmosphere ... secretive vis-a-vis the government as well as [enemies]". Jenkins also said he "did not form a very high regard for how they discharged their duties".

It was only a few years ago that MI5 was brought into any sot the extraordinary thing is that British media organisations like the state- and taxpayer-funded BBC take such an active part in the MI5-inspired campaign of harassment. We have after all heard of MI5 trying to bribe broadcast journalists; but surely there must be a substantial number who are not bought or blackmailed by the Security Services, and who take part in the "abuse by newscasters" of their own volition? The BBC is supposed to be independent of the government of the day as well as the Establishment in general. While perhaps it is childish to think that the BBC is anything other than effectively state-controlled, the degree of collusion between the BBC and the British Secret Police MI5 is something you would not find in many countries. Individual tele-journalists in other countries would have enough self-esteem not to allow themselves to be controlled by their secret police - seemingly, BBC broadcasters like Martyn Lewis and Nicholas Witchell have such a low opinion of their employing organisation that they see no wrong in dragging the BBCs no-longer-good name through yet more mud, at the mere request (whether supported by financial or other inducements) of the British secret Police, MI5.

And when challenged, these broadcasters LIE about their involvement, with just as little shame as MI5 themselves. The BBCs Information dept have said that;

"I can assure you that the BBC would never engage in any form of surveillance activity such as you describe"

which is an out-and-out lie. Buerk and Lewis have themselves lied to their colleagues in the BBCs Information department over the "newscaster watching", but unsurprisingly they refuse to put these denials in writing. Doubtless if the "newscaster watching" ever comes to light, Buerk and Lewis will then continue to lie by lying about these denials. So much for the "impartial" BBC, a nest of liars bought and paid for by the Security Services!

It is obvious that the persecution is at the instigation of MI5 themselves - they have read my post, and only they have the surveillance technology and media/political access. Yet they have lied outright to the Security Service Tribunal. Similarly, BBC newscasters Michael Buerk and Martyn Lewis have lied to members of their own organisation. The continuing harassment indicates they are all petrified of this business coming out into the open. I will continue to do everything possible to ensure that their wrongdoing is exposed.

MI5 Persecution Update: Friday 11 June, 1999

Harassment in a pub in Clapham, Tuesday lunchtime

Once a month, or once every other month, I meet a Polish friends of mine who lives in Clapham North, and sometimes we go to a particular pub near where he lives. The last time was some two months ago; I did not have my minidisc-walkman with me, and consequently was seriously harassed by people MI5 had instructed to harass me, in the pub.

This Tuesday, 8 June 1999, we again went to the same pub for a pre-meal drink. This time I did have my minidisc-walkman with me. As you can guess, we were followed into the pub by a couple of young people (Im getting older and older - isnt it funny how the MI5 agents all look young these days?). They started talking about my situation, in particular some travel I had booked the previous day. Unfortunately, they were talking fairly quietly, and my minidisc didnt pick up their speech.

MI5s schizophrenic reasoning is that simultaneously I am very important and worthy of their acts of persecution, and I am also totally unimportant and their abuse of me "doesnt matter". Perhaps they should test their agents and managers for obsessive personalities or psychotic features in the same way as employees are drug-tested. MI5 might lose their "worst cases" employees if some psychological testing were applied to their recruitment procedure.

Toothless Watchdogs. What a Surprise.

Recently I have been engaging in communications with two watchdogs, the Security Service Tribunal which deals with complaints against the security service (and always clears MI5 of any wrongdoing), and the Data Protection Registrar, which is mandated to investigate misuse of personal data held on computer.

In a letter to Nick Brooks, Security Service Tribunal secretary, dated 20 April, I asked him if the Tribunal, as an allegedly independent body, had the means to investigate complaints against MI5 other than asking MI5 to themselves investigate complaints. To my disappointment, his reply two weeks later answered the question only indirectly, in the negative. Whatever the reader might think of the merits of the case I have been putting before you in faxed articles this last year and half, you will surely recognise that it is a significant anomaly for the Tribunal to have no independent means of investigating complaints, particularly given the view expressed even by previous home secretaries that the security services are untrustworthy.

MI5 Persecution: No Justice for the Victims of MI5

In a previous article I detailed the similarities between the current MI5 Persecution in England, and other historical instances of similar persecution, notably that by the Nazi Germans in the thirties and forties. The Germans persecuted first the mentally ill, the epileptics and those suffering from schizophrenia, then moved on to racial groups; in todays Britain the persecution is again directed at those with mental illness, which the British in their cowardice find easier than taking on racial groups as the Germans did. But just as in Thirties Germany there was no recourse against a malign and omnipotent state, so the MI5 Secret Police in the modern British Fascist State allow no justice for their victims.

No Recourse Against the Security Services Illegal Harassment

It has become apparent to me over the last nine years just how loaded the dice are in todays Britain, a fundamentally fascist country which masquerades as a democracy. Britain is a democracy in name only; the Establishment, the defence and MI5 secret police are always there, regardless of which party has been voted into power most recently - and from "New Labours" conduct in office one finds it difficult to tell them apart from Old Tories, in their crackdowns on the sick and vulnerable in society.

In thirties Germany the victims of the Nazi regime had no legal recourse against their State oppressors; and in todays Fascist British state, the victims of the Establishment and its MI5 Secret Police similarly have no recourse against the illegal state-funded and organised oppression. There is supposed to be a mechanism for dealing with MI5 crimes, in the shape of the Security Service Tribunal and Commissioner; yet these have never found favour of a plaintiff. One might as well ask the Nazi SS to investigate crimes against epileptics or Jews as ask the Security Service Tribunal to investigate MI5 crimes against British citizens; it is quite obvious what the answer is going to be, regardless of what you say to them, and what evidence you provide. The Tribunal and Commissioner are a mere formality, a whitewashing body to give the Secret Services a veneer beneath which they hide their shabby criminality.

"Institutional Racism" and Bigotry in the Metropolitan Police

The recent inquiry into the racist murder of Stephen Lawrence found clear evidence of systematic and deliberate racism in the Metropolitan Police, which cannot have surprised anyone. Commissioner Sir Paul Condon accepted a somewhat lukewarm definition of institutional racism as being "unconscious". In truth, and this truth must surely be obvious to anyone who has any familiarity or encountered the great British police, the Met has not just "unconscious" racism, but very clearly "conscious" and deliberate racism, of the kind that would have done Thirties Germans proud. And it is a bastion of such open racism - when many other parts of society are learning to live in a multicultural environment, the Met is still living in the past in its attitude to the minorities.

But in addition to the systematic racism confirmed by the Lawrence inquiry, there is also something much more relevant to this case, which is systematic police bigotry against the physically and mentally disabled, which I personally have experienced in my dealings with the police over the years. You cannot expect equal treatment if you are mentally disabled. I tried to make a complaint to the police in 1995 about the harassment I had been subjected to for several years. As soon as they found out I had mental illness, they refused to even talk to me. I tried again in March 1999; the police made various threats to me, while ranting about "your paranoid rubbish" in reference to the complaints expressed to them.

The police refusal to do the job they are employed and paid to do is extremely serious, particularly as this case is highly important, indeed key to the whole issue of British self-perception at the end of the 20th century and the beginning of the 21st century. Britain has lost much in the last fifty years - it has lost an empire, it has lost its self-respect and its identity as a people. If the MI5 persecution finally makes it into the light and the Security Services are seen for the rather cheap bullies their behaviour indicates, it will have a massive and harmful effect on British self-perception in the new century.

Security Service Tribunal - Blatant Whitewashing

A few weeks ago I spoke on the phone to Nick Brooks, the Secretary of the Security Service Tribunal, which is supposed to deal with cases of MI5 transgression. I asked him if the Tribunal had ever found in favour of a plaintiff and against the Security Service. He answered that as far as he knew, it had not.

I also asked Mr Brooks if the Tribunal had any means of investigating allegations of criminal activity by MI5, other than asking MI5 themselves if they had engaged in such activity. His rather circuitous written reply states that the 1989 Security Service Act provides that "it shall be the duty of every member of the Service to disclose or give to the Tribunal such documents or information as they may require for the purpose of enabling them to carry out their functions under this Act". Which is a very round-about way of saying - "No" - the Tribunal has no way of investigating MI5 crimes - None At All.

Setting up the S.S. Tribunal, and creating a Security Service Commissioner, was really an act of falsehood by the government. It is generally recognised that MI5 are out of reach of the normal criminal justice system - the police, as we have seen, have no intesot answer to the government; in a previous article I quoted Roy Jenkins speaking of "a secretive atmosphere.... secretive vis-a-vis the government as well as [enemies]", and a "lack of frankness" from MI5.

If the government wanted to, it could reform the secret services and ensure they acted in conformance with the laws which have been enacted for them in the last ten years. But apparently the present government does not see any need to ensure security service compliance with the law. As noted above, the regulatory machinery for MI5 is deliberately weak; the Tribunal has no independent means of investigation, and it is simply a waste of time complaining to the Tribunal or Commissioner.

Every so often, fresh revelations come to light of secret service transgressions. We have heard from Shayler that MI5 bugged Jack Straw and Peter Mandelson; we have heard from Peter Wright that MI5 plotted to see Wilson ejected from office; yet so closed is the system of government that the law is never enforced against MI5 when they "bug and burgle" everyone from politicians to ordinary citizens.

No Justice from the Legal System, either

Britain has a civil and criminal justice system which effectively limits many complaints from being heard. For a civil complaint to be brought before a court, you need a solicitor willing to act on your behalf. Supposedly it is possible to represent yourself as a Litigant-in-Pthe basis of being "frivolous and vexatious" or "disclosing no cause for action in law". This is exactly what happened to me in 1997 when I twice tried to take the BBC to court for spying on me in my living room at home; my case was twice struck out, and on the second occasion an order was made against me that I could not bring further civil litigation against the BBC without leave of the court.

As the reader can guess it is quite impossible for a person with schizophrenia, who complains about the secret services and media interfering in his life, to find a solicitor willing to represent him in legal action against the persecutors. I have quite a lot of evidence of the continuing persecution which I have posted on the website, even if the evidence is quite tentative and perhaps open to varying interpretations. But I have tried several firms of solicitors; some of them have acted unprofessionally and abused me; all of them have refused to represent me. My psychiatrist gave me the name of the firm of Bindman and Partners in central London, and I have approached them twice. On each occasion they refused to accept my instructions. Plainly the problem with Bindmans, which they have admitted, is their bigotry against mentally disabled people; yet this is not just something that is wrong with Bindmans, it is something that is wrong with the legal system as a whole, since the legal system necessitates finding a solicitor willing to represent you in order to bring a case to court, but it does not have a mechanism for providing a lawyer in the case where no solicitor is willing to take on your case. So the British legal system is such as to prevent cases such as mine from ever receiving an airing in a court.

So much for the civil courts. But the criminal justice system is no better. Two years ago the Protection from Harassment Act came into force. But again, while the Act is all very well on paper, in practice it is unenforceable in my case, since it would require Police action to see the law implemented, and if the police cannot even be trusted to conduct a murder investigation competently (in the Lawrence case), then what chance is there of their investigating complaints against the Security Service? Of course, it would be possible for me to personally issue proceedings through a private prosecution either against MI5 themselves, or against one or more of their media tools; but here we see the same problems as with the civil courts, because first of all I would have to find a lawyer willing to act on my behalf. Litigants-in-person do exist in the criminal courts, but the Attorney General can bring such a prosecution to an end by taking it over and entering a plea of "nolle prossequi"; and I suspect that if I were to bring a private prosecution against either MI5 or one of their media tools, then this is exactly what would happen.

So much for British justice. But if anything the wrongs that have been perpetrated on me by the British justice system are quite mild to what others have suffered. Others have been wrongly convicted based on police evasions and lies, and spent many years in jail based on false charges. I should count myself lucky that despite the best efforts of the MI5 secret police, I have not acquired any criminal charges or convictions; which shows that for all their resources and influence, and the clear imperfections in the British legal system, there are still limits on how much subversion MI5 can achieve.

The latest in a long line of injustices

A comment I heard during the recent scandal of the police mishandling of the Lawrence murder investigation is that "its not as if the police themselves murdered him". This is not a particularly wise statement to make about the case, since it could be argued that the four alleged murderers were aided in their crime by the expectation that the police would deliberately botch the investigation - which of course is exactly what the police did.

But in my case, this would be a completely inaccurate thing to say - since the MI5 secret-police have expressly been trying to nine years now to see an end put to my life, either by having me incarcerated and my liberty ended, or by forcing self-termination on me. It is exactly as if the secret police "themselves murdered [me]", since that is what their aim is in their campaign against me.

The public has heard of instances of police mishandling of cases, of police manufacturing evidence, lying in court, extracting false confessions to clear up crimes, et cetera. Various instances of extra-legal activity by the secret services have also come to light in the last few years. The unhappy truth is that what MI5 have been doing to me for the last nine years is really nothing out of the ordinary for them. To me it seems unbelievable that this sort of systematic campaign of harassment, which thousands and thousands of people in this country and abroad are well aware of, could exist for such a long period of time with the media maintaining "omerta". But my case is not the first such instance of persecution by the "British secret police", and judging by the lack of any real controls on MI5, I very much doubt it will be the last.

MI5 Have Systematically Destroyed My Life

This is getting depressing. From the feedback Ive received, the recipients of these faxes are tired of hearing my complaints, and in truth I am tired of sending them. The reason I havent yet ceased sending faxes is because I cannot think of any other effective means of replying to MI5s actions against me, and I feel I have to do something to try to defend myself. Three/four years ago I got the MI5 harassment out of my system by posting about it on Internet newsgroups, and for a few months this tactic was quite effective - I received (and indeed still do today) support from newsgroup regulars, and felt I could make my voice heard and break the MI5 monopoly on access to the British media. But that was years ago, and today nobody gives a tinkers cuss about my internet posts - so I have sought to escalate matters by communicating directly with the politicians who allegedly say how this country is supposed to be run.

Of course, its quite expensive to keep up a campaign of fax messages for many weeks. Each set of faxes takes approx 50 hours to send over the weekend, and costs perhaps 35. My phone bill for the last quarter was 350. These figures are naturally insignificant compared to what MI5 have been spending against me over a similar period. It also takes a lot of time and energy to create a new article every week, and try and find new and fresh aspects and viewpoints on MI5s persecution of me. I am beginning to run out of both new topics and energy to write these articles.

So I have a suggestion to put before the MI5 persecutors who have been wrecking my life since 1990. In a few days time I will be going on holiday to Poland and Germany, for a couple of weeks. Previously, almost every time I have travelled by plane, or gone anywhere on holiday, the MI5 "wreckers" have been most assiduous in destroying these trips. My suggestion is; if MI5 leave me alone on this next trip, I will cease transmitting these articles. If, however, there are any clear instances of harassment (and I am very capable of recognising MI5 harassment when I see it), then I will make public these instances and publish any recordings I may make of them, and, unwillingly and unhappily, continue the articles.

Read about the MI5 Persecution on the Web

Keith Hill MP (Labour - Streatham), my elected representative, as ever refuses to help.

MI5 Refuse to Allow me to have a Normal Life

Its kind of difficult to contemplate having a normal existence when you know your entire house is bugged from top to bottom, for audio and, very unpleasantly, video; when your employment is systematically destroyed, over and over again; when every time you leave the country your travel is disrupted by MI5 plants on the plane yelling abuse at you..... you get the idea. I would like to have some semblance of a normal life, like my Polish and English friends do. But MI5 have made this impossible, and they have leached massive resources from the taxpayer to institute a life not worthy of the name on me.

A few years ago MI5 were very open about their aims in persecuting me. They were shouting "suicide" at me, both in Canada where I lived at the time, and during my occasional visits to London. You cant get much clearer than that. There have been instances as recently as a few weeks ago of this intention being voiced by their side; on 15 April 1999, a woman at the next ticket counter at the Royal Festival Hall said;

"it would kill it, you know, it would just be overkill... they can't stop can they"

meaning that "they" were trying to "kill it" i.e. me and they "cant stop". The audio file is at;

I wonder why they "cant stop". Nobody (who doesnt know already) believes my claims - so what difference would it make, if they were to "stop" persecuting me? Perhaps what this persons remarks indicates, is the depth of the obsession MI5 have with this case. They have chosen at random a person from the general population, and done their worst to ruin my life. What is wrong with these people, that they persecute a national of the country whose citizens they are supposed to protect?

No Chance of a Harassment-Free Job

Since the harassment started in 1990 I have had three jobs, the first near Guildford, the second in Oxford, and the third overseas in Canada. All three jobs have been systematically destroyed by MI5. It is so ironic that

MI5 employs a team of agents, each well compensated for their efforts, to persecute just one person paid a mere fraction of what they get for their "work". In fact, it is a joke that MI5 is allocated resources for this sort of effort. If this area of government were run along commercial lines then MI5 would be very rapidly closed down, they produce nothing of any value, instead spending their time obsessed with the bugging and surveillance of their former employees like Shayler, dangerous subversives like Straw and Mandelson, and "threats to national security" like yours truly.

Applying for my first post university job

When I was applying for my first post-university job in the closing months of 1990, I found at two or three job interviews that MI5 had got there ahead of me. Interviewers knew what words to repeat from what had been said at my home recently; MI5 had supplied them with words to hurt me, and the "British secret police" were trying to wreck my job search and discourage me from joining the world of work. This and the continuing harassment in the media and by the public meant that the search for a job took very much longer than it would ordinarily be expected to take for a person with my qualifications.

With my first job near Guildford came the knowledge that MI5 were doing everything possible to make me lose the job. Despite their efforts I managed to stay in work for ten unhappy months, during which they made very clear to me that they were bugging my workplace, my accomodation in Woking, my car, my home..... and they also made clear that they had "got to" my employer in Guildford.

Employment with Oxford

I was able to find a new job, with Oxford Computer Training Services (now ARIS/Oxford), quite quickly. But it became very clear, very quickly, that MI5 were treating this job the same as the first; they tried to get the other employees and in particular the managers to attack me. It was plainly MI5s intention that I be sacked fro this job. But I was not sacked; instead, after almost a year of abuse from OCTS managers, I was forced to seek medical help, and had to take two months off for medical leave. OCTS MD Hugh Simpson-Wells was motivated in keeping me on by the fear that if he sacked me, then I would take him to court for the treatment OCTS managers had meted out to me during 1992.

Emigration to Canada

When I emigrated to Canada in 1994, I did think that perhaps MI5 would leave me alone, given that I had made the effort to leave the UK and try to find a new life overseas. I could not see any reason why they would continue to harass me over in Canada. But clearly the MI5 agents had their salaries to think about, since continue to harass me they most certainly did, at my home in Ottawa, and by getting fellow employees to speak against me, as had happened with previous jobs in the UK.

MI5 are denying me a future in work

Former Chief Constable of Devon and Cornwall John Alderson had this to say regarding MI5's activities;

"MI5 is not under the same restraints as the police. They infiltrate organisations, people's jobs and lives. They operate almost like a cancer."

Currently I am on disability, and I can see that MI5 are denying me a future in work. It would be an insult to logic for me to return to work and find a job, in the knowledge that an entire team of MI5 agents, paid in total many times what I would be earning, would have the objective of seeing me "done down" in the employment, and ejected from the place of work. This situation is completely wrong and nonsensical - I would very much like to have a job, but MI5 are preventing me from even thinking about returning to work. The culture of secrecy in MI5/MI6 means there is no objective oversight of their expenditure, when external oversight and greater transparency might lead to wasteful and illogical operations such as that against me being shelved.

Watched and Harassed at my Home and Accommodation

As you will know if you have been reading these articles, MI5 have watched and harassed me at my home, and at every accommodation Ive had since 1990. Theyve also watched me at neighbours houses in London, and at short-term accommodation such as hotels and bed-and-breakfasts. They have used the "words" gained from these watching activities against me, by passing these words on to other people such as OCTS managers for them to make clear that I am being watched where I live.

Harassed at rented rooms in Oxford in 1992

This was at its worst in 1992 in Oxford, where during the week I lived at rented accommodation in Oxford, and at weekends returned to my parents home in London. I was being severely harassed by managers at my place of work, OCTS; and it was clear from the things they said that they were being supplied by MI5 with details of my home life, that they were being supplied with words to repeat at me.

In 1992 I moved house in Oxford many times, living at a total of five rented accommodations in ten months. In January I started off living in a rented room at Headington near the ring road / A40 intersection; then when it became clear that house was being bugged, moved to a rented room in Botley, some miles away. It was at the house in Botley that I had an "interactive watching" experience with Martyn Lewis while he was reading the news; I threw a term of abuse at him; he first flinched, then gave a gsult of what I had just said, he was no longer "on my side".

So I moved house again. This time to a place in Cowley, near the Rover car works, where I stayed for a few weeks. Because of continuing harassment at work, I soon moved from this accommodation, to yet another rented room on Iffley Road. By this time I was very ill and being abused continuously at work. Again, MI5 followed me to the rented room on Iffley Road, and created new instances of "newscaster watching". There was a television in the room which I watched, and as you can guess the newscasters got at me when I was watching the television. Also once I was assaulted, if thats the word for what happened, on leaving the house; a youth grabbed me by the coat lapels, roughed me up a bit with various terms of abuse. I did not report this assault to the police, because what was happening to me at work was very much worse, and nobody seemed to think that that was worthy of being reported to the police. Later that day at work, Alex G, a fellow employee, said "I heard he was assaulted".... I had not told anyone at work about the incident that morning..... so once again it was made very clear that MI5 were watching my rented accommodation and giving information about what was going on there to managers at work.

So I moved house yet again in late autumn 1992, this time to a rented room in a large house on Woodstock Road. I stayed there for several weeks as the situation at work deteriorated due to OCTS managers abuse, until I was forced to take sick leave from work for two months and attend hospital as an outpatient; at which point I gave notice on the room, and returned to London.

MI5 continued to harass me after the diagnosis of serious illness was made. As reported previously, they harassed me on a flight to Spain in December 1992; and in 1993, when I returned to live and work in Oxford, they again bugged my rooms, as well as my workplace, although the intensity of the harassment was very much less than in 1992.

Watched, followed and harassed in Canada

It dismayed me to find that MI5 would not leave me alone after I had settled in Canada. In January 1995 I rented an apartment at the Bayshore complex in Ottawas west end. For some weeks there was no sign of the "buggers". But then it started all over again. They first bugged my car, which had a car alarm installed - the alarm went off two or three times in a single evening, and the following day gave a signal that the car had been broken into. Then they bugged my apartment, and in particular they installed bugs on the phone line in my apartment.

In September 1995 I moved to a new apartment in Ottawas Bytown Market area, the restaurant and entertainment heart of Canadas capital. This proved a serious mistake. In the west end I had been fairly distant from the centre of town where MI5 concentrated their efforts at turning people against me. In the Market area it was much easier for the persecutors to motivate people to harass me, and over the next couple of years there were frequent instances of harassment by the general public.

From 1995 I had some Polish friends in Ottawa, and as the reader can guess, MI5 have spent much effort trying to break up this friendship. They supplied various things about my home life to these friends, for example where I was living in the Market, directly over the road were the studios of a music radio station, which you had to "look up" to see; and MI5 told these friends that I was "looking up" to see the radio station; so the friends then replayed these words back to me, that I was "looking up". MI5 have also made various sexual slanders against me, and these friends also unwittingly replayed some of the words they had been imprinted with by the MI5 persecutors.

MI5 Will Never Allow Me to have a Normal Life

I have heard many excuses as to why MI5 continuously prevent me from having a normal life. We are told that MI5 are defending the country against a tere to zero.

When I have travelled abroad, they always put their people on the flights, on the journeys I undertake, to continue the harassment, so that I am put off further overseas travel, and chained to my home in London. Yet even this is illogical, because when I lived in Canada, they would still put people on flights back to the UK.... and what possible reason would they have for doing that? Perhaps the truest words to describe the MI5 persecution is that reason has nothing to do with their activities - sane people do not behave in the way the MI5 British Secret Police have been doing.

Summer 1999 - more MI5 harassment?

In only a few days time I will be going to Europe again. This time I have deliberately chosen to travel by a non-UK airline; so we will see if they put their paid agents on this foreign carrier, we will see if they try to harass me on this non-British flight.

If they do harass me on this trip to Europe, or if they resume the harassment in London after I return home, then I will continue to report their activities in these faxes. As I said at the beginning of this article, I would very much like to not have to send these articles any more, but that is not my decision to make - it is entirely up to MI5 to cease their pointless persecution of me, once and for all.

Why don't you just ignore the whole thing? Who gives a crap if your house is bugged, what are you saying and doing that could possibility be of any interest. Make yourself the most boring subject in the world, and forget about it. If they want to bug you and report on your normal little life, so be it. Just bore the hell out of them. Go on with your life, do a job that you don't get paid for, and you can't be fired from. Why would you care about their stupid comments, you're letting them win if you don't.

> This is getting depressing. From the feedback Ive received, the recipients of these faxes are tired of hearing my complaints, and in truth I am tired of sending them. The reason I havent yet ceased sending faxes is because I cannot think of any other effective means of replying to MI5s actions against me, and I feel I have to do something to try to defend myself. Three/four years ago I got the MI5 harassment out of my system by posting about it on Internet newsgroups, and for a few months this tactic was quite effective - I received (and indeed still do today) support from newsgroup regulars, and felt I could make my voice heard and break the MI5 monopoly on access to the British media. But that was years ago, and today nobody gives a tinkers cuss about my internet posts - so I have sought to escalate matters by communicating directly with the politicians who

> allegedly say how this country is supposed to be run.
>

```

There was a fellow like this at Washington University in St. Louis back in the 70's who put a note on everyone's car saying how the CIA was doing mind control experiments on him while in class by shining laser beam in his eyes, and on and on. They got him professional help.

Just a suggestion MI5-Victim. And wouldn't it be MI6 anyway?

Keith

>>
>> No Chance of a Harassment-Free Job
>>
>> Since the harassment started in 1990 I have had three jobs, the first
>> near
>> Guildford, the second in Oxford, and the third overseas in Canada. All
>> three jobs have been systematically destroyed by MI5. It is so ironic
>> that
>> MI5 employs a team of agents, each well compensated for their efforts, to
>> persecute just one person paid a mere fraction of what they get for their
>> "work". In fact, it is a joke that MI5 is allocated resources for this
>> sort of effort. If this area of government were run along commercial
>> lines
>> then MI5 would be very rapidly closed down, they produce nothing of any
>> value, instead spending their time obsessed with the bugging and
>> surveillance of their former employees like Shayler, dangerous
>> subversives
>> like Straw and Mandelson, and "threats to national security" like yours
>> truly.
>>
>> Applying for my first post university job
>>
>> When I was applying for my first post-university job in the closing
>> months
>> of 1990, I found at two or three job interviews that MI5 had got there
>> ahead of me. Interviewers knew what words to repeat from what had been
>> said at my home recently; MI5 had supplied them with words to hurt me,
>> and
>> the "British secret police" were trying to wreck my job search and
>> discourage me from joining the world of work. This and the continuing
>> harassment in the media and by the public meant that the search for a job
>> took very much longer than it would ordinarily be expected to take for a
>> person with my qualifications.
>>
>> With my first job near Guildford came the knowledge that MI5 were doing
>> everything possible to make me lose the job. Despite their efforts I
>> managed to stay in work for ten unhappy months, during which they made
>> very clear to me that they were bugging my workplace, my accomodation in
>> Woking, my car, my home..... and they also made clear that they had "got
>> to" my employer in Guildford.
>>
>> Employment with Oxford
>>
>> I was able to find a new job, with Oxford Computer Training Services (now
>> ARIS/Oxford), quite quickly. But it became very clear, very quickly, that
>> MI5 were treating this job the same as the first; they tried to get the
>> other employees and in particular the managers to attack me. It was
>> plainly MI5s intention that I be sacked fro this job. But I was not
>> sacked; instead, after almost a year of abuse from OCTS managers, I was
>> forced to seek medical help, and had to take two months off for medical
>> leave. OCTS MD Hugh Simpson-Wells was motivated in keeping me on by the
>> fear that if he sacked me, then I would take him to court for the

>> treatment OCTS managers had meted out to me during 1992.
>>
>> Emigration to Canada
>>
>> When I emigrated to Canada in 1994, I did think that perhaps MI5 would
>> leave me alone, given that I had made the effort to leave the UK and try
>> to find a new life overseas. I could not see any reason why they would
>> continue to harass me over in Canada. But clearly the MI5 agents had
>> their
>> salaries to think about, since continue to harass me they most certainly
>> did, at my home in Ottawa, and by getting fellow employees to speak
>> against me, as had happened with previous jobs in the UK.
>>
>> MI5 are denying me a future in work
>>
>> Former Chief Constable of Devon and Cornwall John Alderson had this to
>> say
>> regarding MI5's activities;
>>
>> "MI5 is not under the same restraints as the police. They infiltrate
>> organisations, people's jobs and lives. They operate almost like a
>> cancer."
>>
>> Currently I am on disability, and I can see that MI5 are denying me a
>> future in work. It would be an insult to logic for me to return to work
>> and find a job, in the knowledge that an entire team of MI5 agents, paid
>> in total many times what I would be earning, would have the objective of
>> seeing me "done down" in the employment, and ejected from the place of
>> work. This situation is completely wrong and nonsensical - I would very
>> much like to have a job, but MI5 are preventing me from even thinking
>> about returning to work. The culture of secrecy in MI5/MI6 means there is
>> no objective oversight of their expenditure, when external oversight and
>> greater transparency might lead to wasteful and illogical operations such
>> as that against me being shelved.
>>
>> Watched and Harassed at my Home and Accommodation
>>
>> As you will know if you have been reading these articles, MI5 have
>> watched
>> and harassed me at my home, and at every accommodation Ive had since
>> 1990. Theyve also watched me at neighbours houses in London, and at
>> short-term accommodation such as hotels and bed-and-breakfasts. They have
>> used the "words" gained from these watching activities against me, by
>> passing these words on to other people such as OCTS managers for them to
>> make clear that I am being watched where I live.
>>
>> Harassed at rented rooms in Oxford in 1992
>>
>> This was at its worst in 1992 in Oxford, where during the week I lived at
>> rented accommodation in Oxford, and at weekends returned to my parents
>> home in London. I was being severely harassed by managers at my place of
>> work, OCTS; and it was clear from the things they said that they were
>> being supplied by MI5 with details of my home life, that they were being

>> supplied with words to repeat at me.
>>
>> In 1992 I moved house in Oxford many times, living at a total of five
>> rented accommodations in ten months. In January I started off living in a
>> rented room at Headington near the ring road / A40 intersection; then
>> when
>> it became clear that house was being bugged, moved to a rented room in
>> Botley, some miles away. It was at the house in Botley that I had an
>> "interactive watching" experience with Martyn Lewis while he was reading
>> the news; I threw a term of abuse at him; he first flinched, then gave a
>> gsult of what I had just said, he was no longer "on my side".
>>
>> So I moved house again. This time to a place in Cowley, near the Rover
>> car
>> works, where I stayed for a few weeks. Because of continuing
>> harassment at
>> work, I soon moved from this accommodation, to yet another rented room on
>> Iffley Road. By this time I was very ill and being abused continuously at
>> work. Again, MI5 followed me to the rented room on Iffley Road, and
>> created new instances of "newscaster watching". There was a television in
>> the room which I watched, and as you can guess the newscasters got at me
>> when I was watching the television. Also once I was assaulted, if thats
>> the word for what happened, on leaving the house; a youth grabbed me by
>> the coat lapels, roughed me up a bit with various terms of abuse. I did
>> not report this assault to the police, because what was happening to
>> me at
>> work was very much worse, and nobody seemed to think that that was worthy
>> of being reported to the police. Later that day at work, Alex G, a fellow
>> employee, said "I heard he was assaulted".... I had not told anyone at
>> work about the incident that morning..... so once again it was made very
>> clear that MI5 were watching my rented accommodation and giving
>> information about what was going on there to managers at work.
>>
>> So I moved house yet again in late autumn 1992, this time to a rented
>> room
>> in a large house on Woodstock Road. I stayed there for several weeks as
>> the situation at work deteriorated due to OCTS managers abuse, until I
>> was
>> forced to take sick leave from work for two months and attend hospital as
>> an outpatient; at which point I gave notice on the room, and returned to
>> London.
>>
>> MI5 continued to harass me after the diagnosis of serious illness was
>> made. As reported previously, they harassed me on a flight to Spain in
>> December 1992; and in 1993, when I returned to live and work in Oxford,
>> they again bugged my rooms, as well as my workplace, although the
>> intensity of the harassment was very much less than in 1992.
>>
>> Watched, followed and harassed in Canada
>>
>> It dismayed me to find that MI5 would not leave me alone after I had
>> settled in Canada. In January 1995 I rented an apartment at the Bayshore
>> complex in Ottawas west end. For some weeks there was no sign of the

>> "buggers". But then it started all over again. They first bugged my car,
>> which had a car alarm installed - the alarm went off two or three
>> times in
>> a single evening, and the following day gave a signal that the car had
>> been broken into. Then they bugged my apartment, and in particular they
>> installed bugs on the phone line in my apartment.
>>
>> In September 1995 I moved to a new apartment in Ottawas Bytown Market
>> area, the restaurant and entertainment heart of Canadas capital. This
>> proved a serious mistake. In the west end I had been fairly distant from
>> the centre of town where MI5 concentrated their efforts at turning people
>> against me. In the Market area it was much easier for the persecutors to
>> motivate people to harass me, and over the next couple of years there
>> were
>> frequent instances of harassment by the general public.
>>
>> From 1995 I had some Polish friends in Ottawa, and as the reader can
>> guess, MI5 have spent much effort trying to break up this friendship.
>> They
>> supplied various things about my home life to these friends, for example
>> where I was living in the Market, directly over the road were the studios
>> of a music radio station, which you had to "look up" to see; and MI5 told
>> these friends that I was "looking up" to see the radio station; so the
>> friends then replayed these words back to me, that I was "looking up".
>> MI5
>> have also made various sexual slanders against me, and these friends also
>> unwittingly replayed some of the words they had been imprinted with by
>> the
>> MI5 persecutors.
>>
>> MI5 Will Never Allow Me to have a Normal Life

From what little I've seen in this and a few other N.G.s, this is some sort of automated trolling spam that has plagued a lot of groups for quite some time. What its goal is has been unstated. Don't feed the trolls.

Regards,

Michael

> > PC's have bags of memory now so the old pin limited packages are out
> > of date.

Some of the free packages are based around DOS or early windows where
a megabyte of memory was the limiting factor.

Anyone who has put the effort into writing a "full" PCB software
package is not going to give it away.
It just doesnt make sense, they would be better off pulling pints at
the local pub to make money.
The pin limitation was used to offer cheaper packages to people but
even some of the larger packages I have seen have limitations on them.
I think my software tops out at 32000 pins per package which is an IC
I am eager to see !
In fact you run out of room on the 50 inches by 50 inches layour
before you run out of memory !

Real or troll - I knew a guy who always claimed some similar things of the U.S. government. About 5 years after I had the occasion to meet this screwball - I had heard he tried killing his elderly father. Now - he is where he can't harm anyone - A NUT HOUSE.

Real or not - if this crap exists - it isn't something to be scoffed at - these idiots need help.

This is true, but from an *end user* perspective something like what

ExpressPCB and Advanced Circuits does might as well be the next best thing to free: They create or license reasonably full PCB software (especially in the case of Advanced Circuits) and presumably pay for it off of profits made from fabricating the boards... which ends up being much cheaper (really, probably no more than a few dollars per design) for a hobbyist who isn't cranking out dozens of PCB designs every year and doesn't have particularly high-end requirements.

Contemplating the construction of a medium size SSPA (~800w) and found a few schematics on the net that seem good. However, I'm not finding anything other than relays being used for T/R switches.

How are all the major manufactures providing T/R switches and claiming QSK operation? Are they using PIN diodes? If so, anybody have a link?

>
> Soldering larger QFP type devices: ...

I would add that QFP devices (especially the 0.5mm pitch types) have the most fragile leads of any package type I've worked with. You can easily bend the leads if you jostle an open tray of QFPs. If you do, you have to fix them all before soldering, because there's almost no room for error and nothing to guide the pins on the board. It takes an xacto-knife blade (the sharp edge!) to get in between the fine pitch leads and straighten them.

> Once the part is positioned and tacked, go over the pins with the flux
> pen.

Gently! See above.

> Small devices like 0602, 0805 components:

Tin one pad, then hold the component and reflow that end to tack the part down. Then do the other side. Do the steps in batches (go around and put a bit of solder on one pad (NOT BOTH) of lots of components, then tack them, then finish them).

I've also seen a neat homemade tool for small SMT parts which looks like:

```
  ,---------------|
  |               |
  O             PART
```

It's an arm that rests to the side of the board, with a vertical pin to hold down the parts (eg a sharp toothpick). A tiny finger holding your smt part in place.

Gel flux from a syringe is much better as it minimises the chance of bending the leads. I find that the solder flows better. as well.

Actually all these messages are from the NSA. They are testing their
new software to see if it will detect the embeded terrorist message.
Don't think they have worked out all the bugs, yet.

Paul, KD7HB

Notice the number in parenthesis in the message title? The same title
from different groups have different numbers. When all the messages
with the same title are put in sequence by the number, then the texts
are compared, there is one word different. That word belongs to the
real message. When you do this process to enough messages, you can
discern the original terrorist message.

Another terrorist method is to embed the partial text of a message in
a picture attached to an email. The NSA computers cannot detect the
actual message that way. A person would have to LOOK at the picture
and see if there is a message on a wall, or street sign or whatever.

No, I don't have an aluminum foil hat!

Hey, that explaination makes as much sense as anything else I've seen on line with regard to strange things. Be that as it may, the text is a pain in the ass - being constantly posted and it would be nice if they'd test their stuff out in some "empty" group - or - at least in a lot fewer groups. Tests "should" be able to be done in just one or two groups - I would think.

Yeah, I know. I see them on metalworking, welding, as well as all the
amateur radio related groups.

The NSA problem is they have to be able to catch them on the internet
as people read them. It would be too easy to just pretend to be a user

and go look at the files on Google, etc. So, every time some one
actually clicks on the message, the NSA computer sees it on some ISP
or ATT or USWest interface. They need the randomness for the test!

Well - I suppose the only thing left is to block them so as not to be
bothered and "hope" their tests are successful and fruitful.

Hi All,

Has anyone attempted to use good old fashioned hot melt glue as an encapsulant for modules ?

Probably needs melting in a pot over a flame (with appropriate care).

A mould could me made out of Plexiglass with appropriate draft (angles) and high temperature release agent.

A second thought is to use standard two part fiberglass mix, obviously a lot more rigid, but potting boxes are likely to be needed also.

I guess I could use thin walled pipe to house a long rectifier stack and associated capacitors.

Both of these options seem significantly less expensive than standard epoxy potting compound...

Any thoughts ?

Mark

TenTec used hot melt glue in the VCO modules of the Paragon transceiver, so this glue probably has good RF characteristics (hopefully). The expansion and contraction of this glue over varying temperatures did cause the solder joints to fracture over the years............this was the downfall of the Paragon.
I have used epoxy over the years, with good results. That is the direction I would go.

Pete

Faxes Sent to British Parliament logs

During the 1998-2000 period my records indicate that I sent at least 14,480 faxes to the British Parliament in Westminster, of which 9,138 went via TPC's email-to-fax service and 5,342 were sent via fax-modem direct from my computer. The actual figure is obviously much higher since, for most of this period, whenever a recipient asked to be deleted from my mailing list, I totally wiped all entries including that from the logfile.

In the records "Y" indicates successful transmission from fax-modem, "N" indicates failed transmission from fax-modem.
"E" indicates an error occurred while transmitting via fax-modem and a fax may have been only partly transmitted.
"y" and "n" indicate success or failure via TPC.

In April 2000 I changed the method of operation by recording "R" when a recipient requested removal, rather than wiping their details from my mailing list and records; and keeping "B" records for when TPC actioned a ban on a recipient's fax-number, but the recipient did not write to ask me to cease faxing. The purpose of these changes was to keep more accurate and complete records, but the intention was thwarted by the police complaint.

MI5 Persecution: How Could It Be True?

If you have the patience to read these articles you will be struck by how apparently fantastic the claims being put forward are. You may ask yourself why such seemingly nonsensical assertions are made. This matter has been discussed on the Internets UK-local newsgroups for three years now, and the denizens of the uk.misc newsgroup (the so-called "miscreants") have come up with a number of theories to explain these posts; it has been variously suggested that they are a troll (an artificial creation for the amusement of its author), that they are made by MI5 themselves with the purpose of discrediting other conspiracy theories, and that the poster is mentally ill and the articles are symptomatic of the illness (the view held by most miscreants).

Are these claims the product of mental illness, or is that just a cover?

The most obvious explanation, that the claims made result from the admitted mental illness of the author, is the one which the persecutors intend be the one accepted without consideration being given to the possibility of the claims being true. The persecutors have actually been very clever about this, both in selecting as their target someone who was known from school or university as being borderline schizophrenic, and in ensuring the nature of their persecution corresponds to what often features in the delusions of a schizophrenic.

The very first incident of the persecution occurred in June 1990, when I was still a student at university in London. It consisted of a reaction (giggling) from the newsreader, Sue Carpenter of ITN, to what she saw happening in my living-room at my parents home where I was living. Before your imagination gets the better of you I should make clear that what the newsreader was reacting to was not too embarrassing in nature; my mother had brought an apple for me into the the room, and Sue Carpenter found this amusing.

I recognized that Carpenter had reacted to what she had seen in my living-room, yet this idea still seemed completely fantastic to me. My reaction was to continue watching television, particularly the news, to see if this incident would be repeated. It was, many times, both on BBC and ITV. An intelligent person would have thought to obtain a video recorder and capture some of these incidents in order to try to explain to an observer what he saw in these broadcasts. Unfortunately, I failed this test of intelligence, since I did not record these programmes. I have recently attempted to obtain from ITN tapes of their news programmes dating back to summer 1990, but, unhappily, they have advised me that they do not have complete programmes including newsreaders comments dating back to that period.

From the outset, the persecutors structured their actions to ensure that any complaint would be met with disbelief, and dismissed as delusional. This is why they chose as their target someone who was known at school and university to be borderline mentally ill; and it is why they fired the first shots of their campaign through the broadcast media. Schizophrenics commonly believe the media harass them; it would be exceptional for "full-duplex television" to exist in reality. Those with schizophrenia also commonly believe people are talking about them; again, the persecutors have shown themselves very rarely, but act through intermediaries, both in the workplace, and in public and during travel.

Mental illness is not the cause of these claims, but the simulation of its symptoms is a cover used by the persecutors to deny their victim the ability to have his compaints believed.

What evidence exists to support these claims of "interactive television/radio";?

Quite frankly, I have very little evidence to support my claims. You may examine the "Evidence" area of my website to see such evidence as I have been able to gather. None of it is remotely conclusive. The "smoking guns" all date back to 1990/91, and it is really rather late now to start trying to look for material dating back seven or eight years. In 1997 I started tape-recording every programme I watched or listened to. I also started carrying with me a high-fidelity minidisc-recorder with good quality microphone to catch incidents of public harassment, but this also has not been as successful or conclusive as I had hoped.

Perhaps the best item in the "Evidence" section is the audio file "Life is so hard" (it is labelled with Garfield the cartoon character on the site), which I have given a certainty level of 100%. This item relates to harassment at my workplace in Canada in 1996. A co-worker called Mark was coming up with phrases and expressions which were repeating things being said at my Canadian residence, consequently leading me to believe that my apartment and home phone were bugged, and that the persecutors were passing their gathered information on to Mark. On one particular evening I said in my apartment, "life is so hard, and then you die". The following day I was able to record Mark saying exactly the same phrase at work.

Unfortunately when "they" know you are recording them, they simply dont say things which would unambiguously show harassment. When Mark the co-worker knew he was being recorded, he only made his remarks out of range of the recorder, for example outside the building. When the TV newscasters or radio disc jockeys know they are being taped, they limit themselves to saying things which are ambiguous, which even in my mind may or may not be personally directed against me.

Who knows about this persecution?

Surprisingly many people know. People in the media, such as BBC and ITN newscasters including Martyn Lewis and Michael Buerk, and radio disc jockeys such as Chris Tarrant of Capital Radio, know what is going on, and take part in it. Some co-workers at my former workplaces in England and Canada have known about the harassment. Quite a few people in the general public are also included. I believe the police are aware of the persecution, but, unfortunately, have chosen not to take any action to stop it. I have complained at my local police station in London several years ago, and I have stated on the internet newsgroups that I have done so, hence the police will be well aware of my wish to see the matter resolved. I believe their inaction denotes a dereliction of duty, but without good evidence, I am powerless to compel them to take steps to prevent further harassment, or deal with what has already taken place.

What is the purpose of sending these faxes?

These faxes are being sent to three distinct groups of people, namely Members of Parliament, the media, and diplomats & legal people. As you will have observed I am making use of the email-to-fax gateway at Demon Internet to send these faxes. I am forced to use this gateway since I currently live in North America, and cannot afford the high cost of direct phone calls to the UK.

My purpose in publicising my claims is firstly to discourage the persecutors from continuing their campaign, and also to attempt to bring their campaign out into the open, and thus perhaps identify the persecutors. Neither aim has been achieved yet, but I hope that with sufficient stimulation these aims may yet be accomplished.

The problem with the second aim is that those who read this article will fall into two groups, those who dont know anything about the persecution and consequently will disbelieve my claims as delusional, and those who do know about the harassment and may have some idea of who is behind it, but realise that if the harassers are exposed and the truth brought out into the open, then powerful British institutions will substantially lose prestige, and be exposed to ridicule.

It would give me hope to believe that these faxes will create a third group of people, those who find out that I am telling the truth, and who follow their consciences in standing up and seeing justice done. Only time will tell if this hope will be realized.

Why do you think MI5 are responsible?

The question of who is ultimately responsible for this eight-year harassment is one which is very difficult to answer, as the persecutors have never clearly made their identities known to the persecutee. However, I believe I am correct in attributing the continuing victimisation to elements of the British Security Service MI5, and in this article, I will try to explain the reasons for this belief.

The British internet magazine ".net" featured my website on page 17 of their March 1998 issue (number 42). Their review kindly describes it as an "excellent site" and gives some details of what the net surfer will find there. Should you wish to reply to this article you can do so;

"When did you first suspect MI5 were responsible?"

Over Easter 1995 I went to see a local solicitor in London with a view to talking to the police about the harassment. Soon afterwards I did go to my local police station in Clapham and spoke to an officer there. The solicitor made a comment which suggested to me that the persecution I had been experiencing may have been organised by an intelligence service.

Up to this point, I did not have any clear idea as to who was behind the harassment. Only their agents were visible, in the media, on television news programmes, and on the radio; in the workplace, where things said at my home were repeated verbatim; and in some cases abuse in public and during travel, for example on the trip to Poland in June 1992 which I have already described.

Both from the fact that widely disparate individuals and organisations were employed as agents in the campaign against me, and from the fact that an entity would be required to marshal their resources in the areas of spying on my home and giving gathered information to their agents, it was clear to me that a single entity was responsible for carrying out the campaign. Yet from June 1990 until Easter 1995 I did not have a clear idea of who might be responsible. I guessed that perhaps some private individual or group of persons who saw themselves as my enemies had perhaps paid private detectives to organise the harassment. Alternatively, since the campaign had started in the media, I made a far-fetched supposition that perhaps it was an ad-hoc group of media people who had set themselves up in opposition to me. After Easter 1995 I saw that these guesses were wrong, and I made an I believe much more accurate estimate as to who my enemies really are.

"Why couldn't a private group be behind the persecution?"

There are several reasons why a private individual or group would not be behind this campaign.

Quantity of resources / Money. Here is what one Usenet (internet newsgroup) participant had to say (several years ago) on the topic of how much money it would cost just to keep the surveillance going.

PM: >But why? And why you? Do you realize how much it would cost to keep
PM: >one person under continuous surveillance for five years? Think about
PM: >all the man/hours. Say they _just_ allocated a two man team and a
PM: >supervisor. OK., Supervisor's salary, say, #30,000 a year. Two men,
PM: >#20,000 a year each. But they'd need to work in shifts -- so it would
PM: >be six men at #20,000 (which with on-costs would work out at more
like
PM: >#30,000 to the employer.)
PM: >
PM: >So, we're talking #30,000 x 6. #180,000. plus say, #40,000 for the
PM: >supervisor. #220,000. Then you've got the hardware involved. And
PM: >any transcription that needs doing. You don't think the 'Big Boss'
PM: >would listen to hours and hours of tapes, do you.
PM: >

PM: >So, all in all, you couldn't actually do the job for much less than
PM: >a quarter million a year. Over five years. What are you doing that makes
PM: >it worth the while of the state to spend over one and a quarter million
PM: >on you?

A private individual or group would not spend over a million pounds to verbally torture a victim without some financial motive or gain. Private industry is driven by the profit motive, and there is no financial profit to be had from carrying out a campaign in this way. If a private enterprise were behind it then they would have taken direct physical action a long time ago.

State enterprises, on the other hand, can afford to be wasteful, since they are funded by the taxpayer. They do not have to show a money profit. The employees or contractors employed by a state organisation such as MI5 are driven by their own personal profit motives, to make the most money out of their employers for the longest period of time. MI5 is funded to the tune of #150M p.a.; even a few hundred thousand a year would to them be affordable if their managers could convince themselves of the necessity of what they were doing.

Quality of resources / Technical resources - electronic and other surveillance. In summer 1994 a reputable and competent private detective agency was employed to conduct a counter-surveillance sweep of my home in London. They charged us over #400 for this, conducted a thorough search for radio transmitting devices, hard-wired "probe" microphones and also tested the telephone line. They found nothing. This was not altogether surprising, since it had been made very clear to me that there were bugs in my home; the "buggers" would not have made this clear unless they had felt their bugs were of sufficient sophistication as to be safe from detection.

But there is another lesson to be gained from the failure of the private detectives to find anything. The agency employed was one of the most reputable in London. They were employed on the principle of "setting a thief to catch a thief", for if the harassment were being carried out by private detectives, as I then believed, then surely another set of private detectives would be able to find the bugs that they had planted. That these "private eyes" were unable to find anything, and that the harassers were confident that they would not be able to find any bugs, points to the harassers being an order of sophistication above a private agency, and leads me again to believe that a state intelligence service is responsible for the surveillance and harassment.

Quality of resources / Technical resources - Interception of Postal service. In summer 1994 when I emigrated to Canada to try to escape the harassment, I wrote letters home to my family and friends in London. Quite soon after my arrival in Canada, the harassers were able to find precisely where I was staying. The only way I can see of "their" being able to find out my new address was by interception of my letters to the UK.

Later in 1994, I conducted an experiment to see if my letters home were indeed being read. In a letter home I wrote of being depressed and talked in vague terms of suicide. I deliberately chose this topic, since I believed it was the outcome my harassers were trying to achieve, and that if they read the letter, they would "echo" its contents. Sure enough, soon afterwards there were two incidents of people shouting "suicide" at me in public places in Canada.

It is inconceivable for a private agency to have the ability to intercept postal mail. The state security service on the other hand is well known to engage in these activities.

Quality of resources / Access to Media. One of the strangest aspects of this case is the access "they" have to the broadcast and print media. I still do not understand what could persuade newscasters such as Martyn Lewis and Michael Buerk, who consider themselves "gentlemen", to behave in an almost voyeuristic way by "peeking" into the living room of one of their viewers. A year ago I wrote to the BBC asking if these newscasters would confirm or deny the accusations made against them. The BBC replied that their newscasters had denied the accusations, but refused to do so in writing.

It is well known that MI5 have the ability to plant stories in certain newspapers, but convincing television newscasters to "watch" a viewer while they read the news would surely be very difficult for them to accomplish, unless they presented themselves to these journalists as being, for example, a group in the media who were seeing to it that I got my "deserved" treatment. MI5 has a history of manipulating the media, so it might not be too difficult for them to accomplish such a trick, whereas a private group would not have this ability.

"Have they ever denied that they are the Security Service?"

No. Never. This is in fact the main reason why I believe "they" are MI5 and not a privately funded group. If my guess had been wrong then I am sure that "they" would have crowed over my mistake, but they have never admitted nor denied that they are employees of MI5.

In early January 1996 I flew on a British Airways jet from London to Montreal; also present on the plane, about three or four rows behind me, were two young men, one of them fat and voluble, the other silent. It was quite clear that these two had been planted on the aircraft to "wind me up". The fat youth described the town in Poland where I had spent Christmas, and made some unpleasant personal slurs against me. Most interestingly, he said the words, "he doesnt know who we are".

Now I find this particular form of words very interesting, because while it is not a clear admission, it is only a half-hearted attempt at denial of my guess that "they" = "MI5". Had my guess been wrong, the fat youth would surely have said so more clearly.

"If MI5 were behind it, why would they wish to mask their involvement?"

I have heard a number of times a belief from people in the media that it is they, the media people, who are behind the abuse. In spring 1994 Chris Tarrant the Capital Radio D.J. said sarcastically on his breakfast show, "You know this bloke? he says were trying to kill him. We should be done for attempted manslaughter". We, we, we. Tarrant thought it was a media conspiracy.

Returning to the question of "interactive watching" by television newscasters, it would again be much easier for them to take part in that sort of activity if they convinced themselves that the surveillance and abuse were organised by "their own", by media people. It must be second nature to MI5 to mask their involvement in the matters they deal with; in this case, they pretend the campaign is organised by a group in the media, and any journalists who suspect otherwise keep their silence.

Conclusion

Over the last three years I have stated with some force my belief that MI5 are responsible for my misfortunes. I have done so on Internet newsgroups, in letters and faxes to people in politics and the media in the UK, and in 1997 I made a formal complaint to MI5 regarding their activities; the Security Service Tribunal replied in June 1997 that "no determination in your favour has been made on your complaint". (I believe the statement by the Security Service Tribunal can be disregarded, as they have never, ever made a ruling in favour of a complainant.) In three years of naming MI5 as my oppressor "they" have never denied the charge. To me, their silence on this point indicates that my guess was accurate. I believe my persecutors stand identified. The question of why they should carry out this campaign is one I will try to answer in a future article.

MI5 Persecution Update: Friday 15 May, 1998

The persecution has been quite severe for the last week. It appears that my enemies are reacting to the steady stream of faxes making their way over the Atlantic to the fax machines of Westminster politicians and the media. Here is whats happened in the last few days;

The week started off with an incident in the cafeteria at a local shopping centre where I habitually drink my morning coffee. My enemies have concentrated since winter 1995/96 on throwing a particularly horrible sexual slander against me. They "put people up" to repeat this slander against me, and this is what happened again here.

On Thursday morning (yesterday), instead of going to the usual cafeteria I went to a nearby convenience store for coffee. The same horrible sexual slander was shouted at me very loudly by a member of staff as I walked into the store. This was the first time I had ever bought morning coffee in that shop. The other staff obviously knew what was going on, one of them said, "they screwed up my life".

The fax gateway I use to send these faxes to the UK has been working hard these last few days to shut down my access by barring the accounts I use to send these faxes.

I have received an anonymous threat from fax number 0171-219-6101 (the machine gave its name as "ETRA-HoC") which said, "Stop sending to this fax no 0171-219-6101 or else" (the consequences of continued transmission were unspecified). I invited the sender to apologise for his threat, but received no response.

This all adds up to quite a severe reaction to my faxes of the last few weeks. I actually find this quite heartening since it shows that my faxes are finding the mark and there may yet be a breakthrough in my efforts to expose the Security Service conpiracy of abuse against me which has now been going on for eight years.

MI5 Persecution: "Why would they be doing this to you, sir?"

This article will concentrate on the difficult question of "Why". The question which forms the title of this piece was asked of me by the police officer I spoke to in Easter 1995, when I went to make my complaint.

There are really two sides to this question. Firstly, why should MI5 be harassing anybody in this fashion? Secondly, if they choose to behave in this way, why should they have selected me in particular, and not somebody else? Alternatively, why did the persecution start, and why is it continuing?

I do not have definite answers to either side of this question, since my persecutors have usually kept themselves hidden and only acted through other parties. To know "why", one would have to know who the persecutors are, and something of their personalities, since their abuse is almost certainly symptomatic of a personality disorder of the abusers. Certain things however can be deduced about the abusers from the nature of their behaviour, and I will talk about this later in the article.

Why did it start?

It is clear that the persecution must have been initiated by someone who knew me personally, either at school, or at university, or socially, and knew that I was borderline mentally ill, since this is what makes me a target for the persecutors. Unfortunately, the originators have never been identified, and there are several possible candidates. Neither has the link from the originators of the persecution, to the persecutors themselves, ever been made clear. So who are the originators?

University Staff

The identity of the originators may lie in the timing of the persecution. It started in June 1990, while I was finishing a course at Imperial College in London, and a year after I graduated from Cambridge, where I received a degree in computer science. At Cambridge I had achieved some notoriety in the computer lab from various nefarious exploits. Roger Needham attacked me by saying that "there were great hopes for it, but it failed terribly". When I started at Imperial I found that my reputation had preceded me; Cambridge computer lab had spoken to I.C. lecturers about me. I.C. lecturer Frank McCabe summed up commenting about "setting up a straw man so you can tear him down". (Despite being "torn down" by the Cambridge computer labs lecturers, I still achieved a good first degree and a Masters degree at Imperial.)

Other students at university

So, the originators may have been university staff who knew me from my student days. But there are other possibilities. I had other enemies at university, including some fellow students. At my Cambridge college it was common knowledge that my mental health was dubious, and it was known that I talked to myself in my sleep - the floor and walls were quite permeable to noise, so other students heard. I was given the nickname "gibber" because of this habit. Sometime later, I managed to catch myself talking in my sleep when I woke up in the middle of the night.

Here is a quote from a participant in the internet newsgroup where I have been posting for the last three years;

>One thing which has been missing from this discussion is this simple
>prognosis: that maybe he is right and that, despite his admitted
>mental condition, there really is a campaign against him organised by
>now-influential ex-students of his university.

People I knew socially

I had yet other enemies in 1990 (I am a man of many enemies!). In January 1990 I broke up with some people I had been going out with socially. One of them, by the name of Andy Turner, wrote a letter to Alan Freeman, who at the time was a Radio 1 DJ. Freeman read part of the letter out on his Rock Show, about the "one who wore out his welcome with random precision", saying "thats a hell of a letter you wrote there Andy", and "with a schizophrenic youre never alone".

It is my belief that Andy Turner and his friends were trying to make trouble for me, and Turner wrote to Freeman with this in mind. Freeman may have discussed the letter with others, and things may have snowballed from there. This is, of course, pure supposition. The fact is that I do not know who the originators are, and can only guess.

Once it started, why is it continuing?

The answer to this question is obvious. It is unacceptable to the "powers that be" in the UK to have somebody running around who knows he has been targeted by the Security Service and media organizations, and who is in a position to embarrass British institutions. This has become particularly evident in the last week; as I send more faxes to UK politicians and media, so the pressure on me grows, and the volume of abuse increases.

Part of the reason the persecution continues is in the personalities of the abusers, and it is this subject to which I will turn to next, since the key to understanding the persecution lies in understanding those who carry it out, as much as we can.

The Security Service operatives, the persecutors, are they psychopaths?

Let us first examine the definition of the term "psychopath". DSM-IV defines "anti-social personality disorder" as a "pattern of disregard for and violation of the rights of others ... deceitfulness, irritability and aggressiveness ... consistent irresponsibility and lack of remorse". The Harvard Mental Health Letter of Sept 1995 describes these people as using "charm, manipulation, intimidation and violence to control others and satisfy their own needs. Lacking in conscience and in feelings for others, they cold-bloodedly take what they want and do as they please", having "no guilt or regret".

I must say, reading this description of the condition, that it fits the persecutors perfectly. The persecutors have never shown the slightest remorse or guilt. Even when I was severely ill, they continued to abuse me. They have repeatedly blamed their actions on me, which is another trait common amongst psychopaths. They have no respect for my legal or personal rights, and they use intimidation and verbal violence.

If the MI5 operatives are psychopaths then it would explain both why the persecution started, and the degree of verbal violence. Psychopaths by definition damage other people; here, the MI5 operatives find an outlet for their personality disorder, through "cripple-kicking".

Xenophobia on the basis of mental illness, and race

My enemies have made clear many times that one of the reasons they are persecuting me is because of my admitted mental illness. However, it is my belief that they are also persecuting me because I am not of ethnic English origin, and the fact that there have been several incidents of an overtly racist nature reinforces this view.

In one case, two youths on a tube train in London made openly racist references to me as a "soft toy, not up to British Standards". Another person near my home made remarks about "Polish people". In yet another incident in Croydon, a youth made comments about "foreigners".

But the main thrust of their xenophobia is because of my mental illness. I should make clear that I do not look ill; if you met me, you would not know that I had the illness. I take a relatively low dose of medication, and feel quite well. But the persecutors have repeatedly harped on about my supposed serious mental illness; they have called me a "nutter", a "schizophrenic", etc. They have also persuaded other people to use these terms of abuse. They are able to get away with this because abusing the mentally ill is still something which is mostly acceptable in Britain; the media do it, "nutter" is not taboo in the way that "nigger" is.

Conclusion

There are several groups of people who might have wished to cause me trouble, and I still do not know who originated the persecution. Nor do I know how the originators came to be in contact with the (presumed) Security Service operatives who have been carrying out the campaign. To know conclusively why it started, we would have to know who started it, and this information is not available.

However, we can infer some things about the personalities of the persecutors from their methods, and from the degree of verbal violence they employ. It is clear that a main reason for the continuing harassment is the psychopathic disorder of the MI5 agents who carry it out. That they have never been "brought to book" for their misdeeds reinforces their belief that they do no wrong; and, unhappily, until they are brought to book, their persecution campaign looks set to continue.

MI5 Persecution: .net Magazine Applauds my Website

The March 1998 issue (number 42) of .net Magazine reviews the MI5 Persecution website describing it as an "excellent site". The webpages describe in detail the nature of my persecution since 1990 by what are believed to be elements of the UK security service.

(snip image)

You are encouraged to read the web pages which include

- a FAQ section outlining the nature of the persecutors, their methods of harassment through the media, people at work and among the general public
- an evidence section, which carries audio and video clips of media and workplace harassment, rated according to how directly I think they refer to me
- factual descriptions of the state security agencies involved
- scanned texts of the complaints I have made to media and state security

agencies involved
o   posts which have been made to netnews over the last three years on this topic

MI5 Persecution Update: Friday 13 November, 1998

If You Intend To Reply, Please Read This

If you have any questions or observations you would like to share with me, then you are very welcome to reply to my fax number 0171-681-1190. But please.... keep your response to one page if you can! I have had several people faxing my article back to me, including one MP faxing back twenty pages. I do not know if he had anything intelligent to say in his 20-page fax because I applied judicious use of the "Delete" key on my computer. Faxes over a page or two will be deleted without being read.

MI5 Resume Hostilities in Response to these Faxes

When I wrote last weeks "MI5 Persecution Update" I remarked how quiet my life had become. No longer! MI5 have restarted hostilities with a vengeance the past week, in response I believe to the faxes I have been sending to members of the House of Commons.

On Saturday 7 November I went to Clapham Picture House cinema to see the film "Antz" (a very enjoyable film). At the cinema, I was verbally assaulted by a group of teenagers with the words "still crazy", repeated about ten times. There was a film with that name showing at the cinema, but it was clear their abuse was directed at me. I do not look ill, so why would they pick on me? answer, the incident was set-up by the persecutors. One of the teenagers also said to another, "I don't know what we're laughing at".

The following day, Sunday 8/11/98, I was on my way to play squash when I was verbally assaulted by a youth who said "it was so funny", without the slightest trace of humour. What he meant by this phrase was that was funny, and they were trying to humiliate me. I have heard this phrase "it was so funny" used at me before many, many times over the last eight and half years.

Please Encourage Keith Hill MP to Help Me

I live in a bugged house, bugged both for audio and video. My movements are monitored by MI5. The Security Service have followed me to Canada, to Poland and the Continent, to the States. I cannot work anywhere, not in England, not in Canada, because MI5 will destroy whatever employment I am able to obtain. I have asked Keith Hill MP to help me, and he has refused.

The situation is intolerable. It is Mr Hills job to help me out of this mess. So, please, as I said in the last fax a week ago: Do not waste your time returning multiple copies of my faxes to my fax mailbox, as some of you have done. Instead;

Please encourage Keith Hill M.P. to help me.

I am sorry to be using this device to encourage Mr Hill to help, but I think eight and half years are quite enough and it is time something was done to bring this matter to a close.

MI5 Persecution : BBC Newscasters Spying on my Home

This week's topic is the quite extraordinary claim that BBC newscasters such as Martyn Lewis and Michael Buerk have spied on my living room while they read the news. I currently have an advert running for the next six months in Private Eye's "Eye Say" column (at a cost of over #200) which says,"MI5 Persecution - BBC Newscasters Spying on my Home"; the story of my campaign in the Eye is on my Website at; http://www.pair.com/spook/evidence/plaint/priveye.htm

BBCs staff magazine Ariel also ran my advert "BBC Newsreaders Spying on my home" for one issue in the Personal category on 8/July/1997 before it was spotted and axed by editor Robin Reynolds; please see webpage; http://www.pair.com/spook/evidence/plaint/ariel.htm

Beginnings

The very first incident in the "MI5/BBC Persecution" occurred in June of 1990, when a newsreader reacted to what she saw in my living room at home as she read the news. My mother had brought an apple for me into the room, whereupon the newsreader smirked and giggled, apparently finding this funny. I couldn't believe what I was seeing. I carried on watching news and other television programmes to see if presenters would show signs of "interactive watching"; to my surprise, this happened again and again. Unfortunately, I did not have my wits sufficiently about me to videotape these programmes, and it is now almost impossible to obtain recordings dating back to 1990.

Most of the "TV watching" has occurred on the news, and most of it in summer 1990, although some as late as autumn 1993. My website has a few extracts of what might be politicians "getting at" me, in particular John Major and interviewer Dimbleby sharing a joke about the "Knutsford Guardian" which is almost certainly about me.

I sold my portable TV in autumn 1990 and stopped watching television regularly. I realise now that this may have been a mistake. What I should have done was to watch TV and listen to the radio, but tape-record everything and make a note of what each excerpt meant to me. I would then be in a much stronger position as regards to evidence that I am now. That is what I am trying to do now, but unsurprisingly the TV/radio presenters have stopped getting at me, now they know they are being recorded.

Examples of Media Harassment

Here are a few examples which I can still remember of media harassment;

In early 1992 I was watching the BBC news with Martyn Lewis on a small black-and-white portable television at my then home in Oxford. I threw a term of abuse at Lewis; he flinched, then gave a grin and made a comment from which I understood that he had been on my side, but might have changed his mind as a result of what Id just said to him.

Victor Lewis Smith in his TV (BBC2?) program at the end of 1993, had a taxi-driver saying, "theyre all out to get me", to which VLS replied, "but you're quite intelligent aren't you?" (what a nice chap VLS is, compliments no less!)

Paul Daniels the TV magician, sometime in 1990-92 (sorry I can't be more precise but it was so long ago), made a "crying face" and put his face in his hands, which was his way of expressing that I was frequently crying in 1990-92, and that he and other media people found my crying funny.

Kenny Everett (deceased) on some talk show, compared me to a "huge ape" who "scratches himself"; he made some other remarks about what the "ape" got up to which unfortunately I cant remember. (I remember that Everetts comments were quite sympathetic and human, but were obviously about me.)

Stephen Fry on another talkshow (Wogan I think) talking about "masturbatory fantasies", he then referred to me with the words "you prat"; I wonder if the studio audience knew what he was talking about and to whom his comments were directed?

Griff Rhys Jones on Clive James' TV show, made a "lunatic face" (wide fixed grin) to which I said to the TV that he had a "face like a horse's arse", to which Clive James said to GRJ "did you hear that?"

Crimestoppers summer 1990, remarks by a Midlands police officer on the programme, while Nick Ross was presenter (as far as I can remember). The officer talked about "in car entertainment". Nick Ross said to officer, "why don't you stop doing it?" to which he replied, "we can't while he's like this".

BBC2 Newsnight in autumn 1993 had a piece on football hooliganism. A black interviewee said apparently of the hooligans, but in fact of me; "they're just idiots, carry on with the surveillance".

There was an incident with Jonathan Ross which I remember clearly; he was on both BBC and ITV television at the same time, one (ITV I think) was recorded, the other channel was live. Ross has a speech impediment which causes him to pronounce his "r"s as "w". I sarcastically said something about "Mr Woss" to the recorded channel, then turned over to where he was live, and he repeated "Woss" with heavy emphasis and sarcasm.

On the radio, in spring 1994, Chris Tarrant made a sarcastic remark in his morning show, saying "he says were trying to kill him, we should be done for attempted manslaughter", to which another of the studio staff said, "oh no, dont say that". His comment was in reply to a comparison Id made the previous evening between my persecutors and the Polish secret police who murdered dissidents.

Martyn Lewis Denies & Lies, But Wont in Writing

In February 1997 I wrote to BBC Viewer & Listener Correspondence and asked them to investigate the claim that their newscasters had engaged in "interactive watching". They replied that they had asked Martyn Lewis and Michael Buerk whether they had engaged in such practices, and that they had both made verbal denials to VLC, but were refusing to put their denials in writing.

I can understand that they might think that if they were to make written denials to me, then many other people with my condition might write to them with similar questions. But Ive asked a couple of journalists if theyve been writing about me, theyve made written denials, Ive believed them, and I have not put their denials on my website because, since I believe their denials, it would not be relevant to publish them.

To me it looks as if Lewis and Buerk are happy to lie verbally but not in writing, because written falsehoods would place them unambiguously in the wrong, whereas they can try to talk their way out of verbal lies if they are ever caught, or perhaps even deny the verbal lies completely? If they lie without shame, then why would they have any shame about future lies about lying?

One of the strangest aspects of "TV watching" is that Buerk and Lewis have convinced themselves that their "interactive spying" is reasonable behaviour. Martyn Lewis thinks of himself as a "gentleman". He expressed in 1992 that he was "on my side". If this matter ever comes out into the open, I wonder what these newscasters will have to say for themselves, and what the British public will make of their behaviour?

Media Persecution Evidence on my Website

You may directly access the Evidence section on my website at URL;

The category currently contains four video segments, a number of audio files and three published articles. The first video of ITN's John Suchet is unfortunately a mistake - after looking at it again it is obviously not about me. The two Ken Clarke excerpts may or may not be about me; it is funny that he should keep on harping about "paranoia" and "madness", but I have given these ratings of only 30% certainty, as it is more likely that they are not about me in particular, and Clarke is simply displaying the normal prejudices against the mentally ill found in much of society.

The piece I find most interesting is the Dimbleby/John Major interview from April 1997. I have assigned this a 90% rating. Dimbleby starts by emphasising a report from the "Knutsford Guardian". Major recognizes what's going on and joins in with a falsely apologetic "heaven forfend". The emphasis is on the first syllable pronounced "nuts" in "Knutsford", which is repeated three times. Of course this is hardly anywhere near convincing evidence; the really clear items were all in 1990-92, and they are basically unobtainable now.

If you're reading the website, have a look at the two files from David Hepworth's programme on GLR radio. The first one from 21/Feb/1997 has him talking about an "embarassment" of prizes and "absolute obscene", in reference I believe to the verbal sexual abuse that was being used against me at the time (and which unfortunately is still current). In the second file dated 9/May/1997 he again talks about "absolute embarrassment" of prizes, followed by laughter. To my mind he knows I am listening to his programme, and deliberately makes these remarks for my benefit, with very little attempt to disguise their purpose.

Bernard Levin - "Fanatic's Fare for the Common Man"

On 21 September 1991 this article by Bernard Levin appeared in The Times. It is reproduced in the Evidence section of the website, or may be accessed directly at URL;

To my mind, Levin's article described the situation at the time and in particular a recent meeting with a friend, during which I for the first time admitted to someone other than my GP that I had been subjected to a conspiracy of harassment over the previous year and a half.

Levin writes about a "madman running loose about London" who "bursts into tears, and swears it is all true. And it is." I am pleased to agree with his assertion that "it is all true" because the truth is what I presented to my friend in September 1991 and it is what is being presented to the readership of these articles now.

Conclusion

The harassment, in particular media persecution, was at its strongest in 1990-92. Today, I am recording everything I watch, read and listen, and the media have pretty much given up. It is now incidents "in public" which make up what there is of MI5s persecution. But much of the material from 1990-92 still exists in archives, although the organisations which have those archives generally wont make the material available to the public, for copyright and other reasons.

MI5 can no longer employ the media to persecute me, partly because journalists now know who is behind the persecution, and also because I would publish any instances. My mistake during 1990-92 was to not record instances as they happened; Ive learned from that mistake, and know better now.

Hello,
my project is building an automatic antenna tuner for use with my Yaesu
FT900.
could you give me any info in english or french ?
 Kit available ?

Thanks
Alain

===================================
Alain , Could you please be a bit more specific.
What type of antenna feeder do you use or intend to use , coax or twin lead feeder.
If you use twin lead feeder there is an excellent web site for a universal tuner which can be configured for any wire antenna.

Google for PA0FRI.

A magnificently built, balanced output antenna tuner for use with
ladder line, open wire line.

Item is for sale on e-bay Item # 290185692713 Auction ends
Sunday 12/2 at 19:00 Z

Highlights & Features of this tuner:

The twin inductor/current balun design provides a truly balanced
output.

(2) 14 uH roller inductors, coupled to a WW II vintage dial with 25

turns, 1/100 turn markings.

High/Low Impedance Switching: Switches the capacitor bank to tuner's input or output. "HI" position is used for impedances above 50 ohms; "LO" is used for impedances below 50 ohms.

Variable and fixed capacitance controls - continuous range is from 25 to 1250pf @ 4500 Vpk.

Variable capacitor dial is the classic 4-inch National Velvet Vernier.

Beautiful, real wood venier over aluminum front panel.

In Photo 1, the large coil on the right is a coaxial choke balun that goes between the output of the rig and the input of the tuner. Please indicate if you do not plan to use this coil, I will be happy to install a ferrite choke balun inside the cabinet.

Dimensions: H,W,D = 8 X 19 x 15 inches, approximate weight = 30 lbs

Good luck with the bidding,

Bob WB2ICQ

Hi, Bob.
Care to tell us what frequencies,antennas and types of feed lines you
have used the tuner on? Have you ever put RF ammeters in the feed line
to see if it's really balanced?

Did you gear drive or chain drive the two coils? Looks like a nice
job!

Best regards,

Paul, KD7HB

I have a nice one (not plastic or phenolic, but made entirely of diecast aluminum) that I'm offering for $50 (includes shipping to anywhere in Continental U.S.) I can provide photos.

Turns counting dial is a very solidly built, weighs about 1.5 lbs. WWII military issue unit. Counter has 2 digits (99 turns), and displays 1/100 of a full turn.

73,

Bob WB2ICQ

===============
To check whether the feed line is truly balanced also depends on the
symmetry of the antenna. Any 'unbalance can best be determined by
clamping a RF current sensor/meter across both feed lines at the same
time, not by measuring the difference between the 2 lines.

Hi, Frank.
I was just curious to see if Bob ever posted anything other than "for
sale" items. Guess not. Just looking at the pictures I would guess the
tuner doesn't work as described. I will keep my old Dentron.

Hello,

I found this very nice website with a section about Homebrew Butterfly
Capacitor with many photographs.

http://hps.infolink.com.br/py1ahd/gallery21.htm

Does anybody knows where in UK (preferrable in Dorset or London) can I
get aluminum foil, 0.5 centimeters thickness?

Hi Marcelo,
I think that 0.5 centimeter is a typo, it seems to thick, I think it should say millimeters.
As a reference compare the thickness of the brass nuts to the plate thickness.

Mike

I wouldn't call 0.5 cm "foil"...more like aluminum "plate"...that's
almost 3/16 inch thick.  Try http://www.aircraftspruce.com

>Does anybody knows where in UK (preferrable in Dorset or London) can I get aluminum foil, 0.5 centimeters thickness?

I think that figure, cited on the web site, must certainly be a typographical error. There's no way that aluminum sheet which is 0.5 centimeters (5 millimeters) thick would make sense in this application.

I'd believe that it's supposed to be 0.5 mm (rather than 0.5 cm). I can't offer a specific source, since I'm in the United States, but a well-stocked hardware store might carry something of about that thickness. When I look up aluminum sheeting at www.use-enco.com (a U.S. mailorder supplier) the thinnest I see is 0.032", which is around .8 mm I believe.

I do have one specific concern about the butterfly capacitor design you're interested in. Capacitors used for resonating small magnetic transmitting loop antennas need to have low resistive losses, due to the high Q and the high currents in the loop. Butterfly capacitors are often preferred to typical stator/rotor capacitors because they have no "wiping" contacts (which have a relatively small contact area and thus potentially a relatively high resistance). The most-favored type use an all-welded or all-soldered construction, in order to ensure a low-resistance path to all of the plates.

Unfortunately, the homebrew cap you're looking at uses threaded brass rods, brass nuts, and aluminum plates. None of the connections are soldered. The connections to the stator plates will be interference/friction mating (i.e. brass nut, tightened onto aluminum plate) and I'd be concerned that the aluminum will soon oxidize and that the connections may rise in resistance, leading to increased losses over time.

This issue could be largely eliminated if you were to use sheet brass, rather than sheet aluminum, for the stator plates. You could then flux and solder the rods, nuts, and plates together (before installing the acrylic endplates, of course :-) and ensure a solid, reliable, low-resistance current path.

I think you could continue to use aluminum for the rotor plates, if you wish, since the current flow will be across the plate and there will be little or no need for current flow between adjacent plates.

If you do use aluminum plates for the stators,, I'd consider adding a thin smear of a conductive aluminum-compatible anti-oxidant grease (Penetrox, NoAlOx, or a similar product) around the hole in each stator plate, before tightening down the brass nuts. This would help make a reliable contact, and exclude oxygen from the aluminum surface.

I m looking for plans for a 6m amp that uses a pair of 6146's.
I chose these tubes because I have them and already have a power supply that will work with them.
I have about 5 watts of drive and I would like to use a no-tune front end if this is possible.

Jimmie

Will 6146s work at 50 MHz? I know the output power in my TS-520S was already starting to drop off on 10M (about 80-85W if I recall). Even if they will work up there, you won't be getting a ton of power out. Might want to consider a 3-500Z or something like that. They are fairly "inexpensive" at http://www.rfparts.com

No, they were very common up there, and higher. Unless I'm misremembering, they were the output tube in the RCA Carphones for 144MHz (and if I'm misremembering, then it was the 2E26 which I thought was supposed be a lower power version of the 6146).

Look at any ARRL book from thirty to forty years ago, and the 6146 was common in 6 and 2 metre rigs.

Make contact with the Flight Refuelling Amateur Radio Society
(www.frars.org.uk), based near Poole. They will tell you where to find
sheet metal in Dorset.

Hey, good to know :) My ARRL handbooks only go back to the early
80s...still...what kind of power out could you expect at 50 MHz? Maybe
80-100 Watts? Certainly not "planet crusher" status, and I have no idea
what power level he has available to drive an amp...

It is a good size example of Rich's tuner design...  Probably works..
Is not a balanced tuner, however... It is a pair of of unbalanced L-
match's with a common mode input choke...

"COLIN LAMB" <k7fm@teleport.com> wrote in message
news:13kn9l94tadj380@corp.supernews.com...
> 6146 tubes work fine on 6 meters.
>
> Colin K7FM
>

They have been used on 2 meters but I think with some stability problems. I was looking for some data to build one and didnt want to reinvent the wheel doing it. If I design it from scratch it will take me a year, If I take advantage of what someone else has already done it will take me a month or two.

I saw a 4cx250 amp that didnt require neutralization or front end tuning. This was because the grid was swamped with a 200 ohm resistor and driver to amp impedance matching was accomplished via a 4:1 transformer. I was wondering if I could do the same with a pair(3 or 4) of 6146s. I was also concerned with what type of output matching I would require. I know 807s on 6M will not work well with the typical Pi-net design. Another issue is what would be the drive requirements with the 200 ohm resistor or simply how much voltage do I need to drive a 6146. I have about 20 watts PEP to play around with.

Jimmie

Hi, Jimmie.
Look into the Heathkit Seneca transmitter. I used one for years on
both 6 meters and 2 meters. Worked lots of DX on 6 and never had a
problem. Allied also had a 6 meter amplifier using 2 6146 tubes.

Might be cheaper to find one of the Allied amps than to start from
scratch, unless you like that sort of thing!

Thanks for taking the time to give me an explanation, I will try to
find sheet brass, but still don't know where in UK.

I buy Aluminium and Brass sheet from ebay. Last buy was item number
160183295588.
Not cheap though!. Probably much easier to buy a TF801 for a fiver and
dismantle/rebuild the magnificent Gold and silver plated turret capacitors.
There's also a bonus of about 2 square feet of Gold plated, brass sheeting
in there.

Indeed. Besides the venerable Heath Seneca, Heathkit also produced a single-band six meter SSB amplifier that used a pair of 6146 tubes; it matched the Heathkit six-meter SSB phasing type transmitter. HX-30 as a WAG. They weren't big sellers unfortunately, and nice pairs bring good money from collectors. It might be worth searching BAMA for the schematic to garner some ideas regarding screen bypassing, etc.

A 5894 would be a good choice for a dual tetrode in one envelope. When I was in high school my homebrew rig ran a pair of 6146s in parallel on 6 mtr AM.

Some of the old Sideband for the Radio Amateur books published by the ARRL have some 6 meter amps using 6146 tubes. They may be in the transverter section. I know the Radio Handbooks published by Editors and Engineers has some also in the late 50's and early 60's.

Actually, it is very easy to neutralize tubes for a single band. You could cinfigure the amp in a push-pull arrangement, using cross neutralization. Wind your own coils for input and output. I am sure there are a number of circuits around, so you will not have to do anything besides find the article and then build it. 800 volts is a good voltage for the amp. You will be able to drive it with a few watts and any extra power can be used in a swamping resistor for even more stability.

Regulate the screens and you will have a nice sounding amplifier. The 4CX250 will drive with about the same power as the 6146, maybe less - but it requires special sockets, a centrifugal fan and at least 1500 volts (2,000 is better). If you want about 100 watts output, the 6146s will be fine. If you want300+ watts output, the 4CX250 tubes would be worth looking at.

73, Colin K7FM

Hi everybody, I've just put my hands on this "great condition" scope except it doesn't sweep. I am used to work on audio equipment like amps, tuners, etc but this is my first scope and I don't know where to start. I guess it is where some DC level goes up and down like stairs (ther is a name I don't remember. the ramp ?)... Anyhow, would anyone have the schematics or the service manual of this unit ? It would be really appreciated !!!

>
> This issue could be largely eliminated if you were to use sheet brass, rather than sheet aluminum, for the stator plates. You could then flux and solder the rods, nuts, and plates together (before installing the acrylic endplates, of course :-) and ensure a solid, reliable, low-resistance current path.

In the real world, most non-miniature variable capacitors were made with spacers and plates that weren't soldered all together, and generally didn't use star washers or anything except at the connecting posts. But these are generally either all-brass, all-aluminum, all-steel, etc., and not a mismash of different materials. You don't explicitly say so, Dave, but are you implying that it's the dissimilar materials that are the problem, or that it's the use of aluminum? My personal taste would be to make it out of all-brass.

After the 50's, for the miniature variable capacitors, they seem to be made out of material that has been silver-soldered together without any explicit spacer components. (Maybe brazed or spot-welded, in some cases.) This seems to be either an improvement made for VHF/UHF work (remember when 50MHz was UHF?) or an admission that using spacers doesn't make economic sense when components are so tiny.

Tim.

Tim Shoppa <shoppa@trailing-edge.com> wrote:

>In the real world, most non-miniature variable capacitors were made with spacers and plates that weren't soldered all together, and generally didn't use star washers or anything except at the connecting posts. But these are generally either all-brass, all-aluminum, all-steel, etc., and not a mismash of different materials. You don't explicitly say so, Dave, but are you implying that it's the dissimilar materials that are the problem, or that it's the use of aluminum?

It's a combination of both, I think.

A cap of this sort would work quite nicely indeed if it were made out of aluminum, and welded together. I believe that such capacitors are available even today (perhaps on special order). Aluminum's conductivity is certainly high enough, and the thin layer of aluminum oxide on the surface would have no effect on the cap's usability.

The biggest problem with a hybrid aluminum/brass capacitor is that it's hard to get a reliable, low-resistance bond between the two metals. It's certainly not impossible - there are some fluxes and solders which can bond to aluminum - but it's not necessarily easy for the hobbyist to make this work reliably.

Non-welded aluminum air-variable capacitors seem to work find in most applications... but in most applications, the currents flowing through the cap are relatively low, the circuit impedances are relatively high, and thus the resistive losses in the plate/spacer connections are negligible. In magloop transmitting antennas, the radiation resistance is small (often just a fraction of an ohm) and the resistive losses in the tuning capacitor can significantly effect the efficiency of the antenna.

```
>                                                                My

>doesn't make economic sense when components are so tiny.

The highest-quality seem to use silver-plated brass, soldered or
welded together.  This would assure a good electrical connection, and
I believe that this combination of materials and methods also helps
reduce the tendency of the capacitor to drift in value as a result of
temperature changes, or exhibit microphonic effects.  People who build
low-drift VFOs seem to favor this style of air-variable capacitor.

sci.electronics.equipment:9698

Hi all,

Just as a followup : We have repaired our 51013 Boonton diode probe using a double MA4E501 diode from Siemens/MA-COM.

Procedure : probe dismounted, old diodes desoldered (warning : on the N connector side there is a disk capacitor nearly invisible between the diodes' ends and the connector). Common pin of the MA4E501 cut at the shortest and directly soldered on the disk capacitor fitted on the N connector pin, both other pins directly soldered on the 160 ohm serial resistors installed in the original probe serially with the diodes.

Results are not as perfect as the original specifically paired and selected diodes from Boonton (understand : repaired probe doesn't work at 18GHz), however the probe is reasonnably good up to 5GHz : Measured return loss is under 25dB up to 3GHz, under 20dB up to 4GHz, but is above 8dB at 8GHz. We don't have a directionnal coupler between 4 and 8GHz in hands so I don't know the exact limit but it seems to be around 5-6GHz. Sensitivity is around -40dBm, in line with the original.

Of course the probe now needs to be recalibrated, but it is back to life ! For those who are interested we have written a small summary of the repair, with a couple of pictures. It is in french but I guess that pictures will be understandable worldwide ;+). The network analysis plots show the measurement on a reference high end 51081 probe (left) and the repaired 51013 probe (right). See www.alciom.com/fr/download/reparation51013.pdf

Now if anyone have a calibration procedure for the boonton probe I would be interested... The user manual of the milliwattmeter explain how to enter calibration factors for a probe, but no how to measure them...

Friendly yorus,
Robert Lacoste

Hi,

Why pay for what you can have for free?

http://bama.edebris.com/manuals/b&k/1460/

I have both the 1460 and 1470 and the 1470 is just a dual trace 1460. So,
other than the chopper stuff, both are the same.

Cheers,

--
Gregg

I breadboarded up a 6146 6M amp using an HW101 power supply and it seem to work but then I realized(my wife reminded me) that it needed to run off of 12 volts on occasion. This got me to thinking that I could maybe convert an old CB amp to work on 6M. I have a dozen or so old dead ones I bought for parts. One of the thigs I noticed right off the bat after doing some testing is that the existing transformers in the amp dont work worth a hoot on 6M. I am totally ignorant when it comes to designing these things and I was wondering what type of cores I would need to build a 100 watt transformer.

Jimmie

>
> Jimmie

By not working worth a hoot I mean that after making a 4:1 transformer
using the existing cores and a 12 ohm dummy load I got a full scale
SWR reading on 50Mhs and a nearly flat reading on 28Mhz as expected.
After doing some research I am guessing that these cores are made out
of type 61 material and they should be made of type 67 for 50Mhz.

Jimmie

MI5 Persecution Update: Friday 13 November, 1998

If You Intend To Reply, Please Read This

If you have any questions or observations you would like to share with me, then you are very welcome to reply to my fax number 0171-681-1190. But please.... keep your response to one page if you can! I have had several people faxing my article back to me, including one MP faxing back twenty pages. I do not know if he had anything intelligent to say in his 20-page fax because I applied judicious use of the "Delete" key on my computer. Faxes over a page or two will be deleted without being read.

MI5 Resume Hostilities in Response to these Faxes

When I wrote last weeks "MI5 Persecution Update" I remarked how quiet my life had become. No longer! MI5 have restarted hostilities with a vengeance the past week, in response I believe to the faxes I have been sending to members of the House of Commons.

On Saturday 7 November I went to Clapham Picture House cinema to see the film "Antz" (a very enjoyable film). At the cinema, I was verbally assaulted by a group of teenagers with the words "still crazy", repeated about ten times. There was a film with that name showing at the cinema, but it was clear their abuse was directed at me. I do not look ill, so why would they pick on me? answer, the incident was set-up by the persecutors. One of the teenagers also said to another, "I don't know what we're laughing at".

The following day, Sunday 8/11/98, I was on my way to play squash when I was verbally assaulted by a youth who said "it was so funny", without the slightest trace of humour. What he meant by this phrase was that was funny, and they were trying to humiliate me. I have heard this phrase "it was so funny" used at me before many, many times over the last eight and half years.

Please Encourage Keith Hill MP to Help Me

I live in a bugged house, bugged both for audio and video. My movements are monitored by MI5. The Security Service have followed me to Canada, to Poland and the Continent, to the States. I cannot work anywhere, not in England, not in Canada, because MI5 will destroy whatever employment I am able to obtain. I have asked Keith Hill MP to help me, and he has refused.

The situation is intolerable. It is Mr Hills job to help me out of this mess. So, please, as I said in the last fax a week ago: Do not waste your time returning multiple copies of my faxes to my fax mailbox, as some of you have done. Instead;

Please encourage Keith Hill M.P. to help me.

I am sorry to be using this device to encourage Mr Hill to help, but I think eight and half years are quite enough and it is time something was done to bring this matter to a close.

MI5 Persecution : BBC Newscasters Spying on my Home

This week's topic is the quite extraordinary claim that BBC newscasters such as Martyn Lewis and Michael Buerk have spied on my living room while they read the news. I currently have an advert running for the next six months in Private Eye's "Eye Say" column (at a cost of over #200) which says,"MI5 Persecution - BBC Newscasters Spying on my Home"; the story of my campaign in the Eye is on my Website at; http://www.pair.com/spook/evidence/plaint/priveye.htm

BBCs staff magazine Ariel also ran my advert "BBC Newsreaders Spying on my home" for one issue in the Personal category on 8/July/1997 before it was spotted and axed by editor Robin Reynolds; please see webpage; http://www.pair.com/spook/evidence/plaint/ariel.htm

Beginnings

The very first incident in the "MI5/BBC Persecution" occurred in June of

1990, when a newsreader reacted to what she saw in my living room at home as she read the news. My mother had brought an apple for me into the room, whereupon the newsreader smirked and giggled, apparently finding this funny. I couldn't believe what I was seeing. I carried on watching news and other television programmes to see if presenters would show signs of "interactive watching"; to my surprise, this happened again and again. Unfortunately, I did not have my wits sufficiently about me to videotape these programmes, and it is now almost impossible to obtain recordings dating back to 1990.

Most of the "TV watching" has occurred on the news, and most of it in summer 1990, although some as late as autumn 1993. My website has a few extracts of what might be politicians "getting at" me, in particular John Major and interviewer Dimbleby sharing a joke about the "Knutsford Guardian" which is almost certainly about me.

I sold my portable TV in autumn 1990 and stopped watching television regularly. I realise now that this may have been a mistake. What I should have done was to watch TV and listen to the radio, but tape-record everything and make a note of what each excerpt meant to me. I would then be in a much stronger position as regards to evidence that I am now. That is what I am trying to do now, but unsurprisingly the TV/radio presenters have stopped getting at me, now they know they are being recorded.

Examples of Media Harassment

Here are a few examples which I can still remember of media harassment;

In early 1992 I was watching the BBC news with Martyn Lewis on a small black-and-white portable television at my then home in Oxford. I threw a term of abuse at Lewis; he flinched, then gave a grin and made a comment from which I understood that he had been on my side, but might have changed his mind as a result of what Id just said to him.

Victor Lewis Smith in his TV (BBC2?) program at the end of 1993, had a taxi-driver saying, "theyre all out to get me", to which VLS replied, "but you're quite intelligent aren't you?" (what a nice chap VLS is, compliments no less!)

Paul Daniels the TV magician, sometime in 1990-92 (sorry I can't be more precise but it was so long ago), made a "crying face" and put his face in his hands, which was his way of expressing that I was frequently crying in 1990-92, and that he and other media people found my crying funny.

Kenny Everett (deceased) on some talk show, compared me to a "huge ape" who "scratches himself"; he made some other remarks about what the "ape" got up to which unfortunately I cant remember. (I remember that Everetts comments were quite sympathetic and human, but were obviously about me.)

Stephen Fry on another talkshow (Wogan I think) talking about "masturbatory fantasies", he then referred to me with the words "you prat"; I wonder if the studio audience knew what he was talking about and to whom his comments were directed?

Griff Rhys Jones on Clive James' TV show, made a "lunatic face" (wide fixed grin) to which I said to the TV that he had a "face like a horse's arse", to which Clive James said to GRJ "did you hear that?"

Crimestoppers summer 1990, remarks by a Midlands police officer on the programme, while Nick Ross was presenter (as far as I can remember). The officer talked about "in car entertainment". Nick Ross said to officer, "why don't you stop doing it?" to which he replied, "we can't while he's like this".

BBC2 Newsnight in autumn 1993 had a piece on football hooliganism. A black interviewee said apparently of the hooligans, but in fact of me; "they're just idiots, carry on with the surveillance".

There was an incident with Jonathan Ross which I remember clearly; he was on both BBC and ITV television at the same time, one (ITV I think) was recorded, the other channel was live. Ross has a speech impediment which causes him to pronounce his "r"s as "w". I sarcastically said something about "Mr Woss" to the recorded channel, then turned over to where he was live, and he repeated "Woss" with heavy emphasis and sarcasm.

On the radio, in spring 1994, Chris Tarrant made a sarcastic remark in his morning show, saying "he says were trying to kill him, we should be done for attempted manslaughter", to which another of the studio staff said, "oh no, dont say that". His comment was in reply to a comparison Id made the previous evening between my persecutors and the Polish secret police who murdered dissidents.

Martyn Lewis Denies & Lies, But Wont in Writing

In February 1997 I wrote to BBC Viewer & Listener Correspondence and asked them to investigate the claim that their newscasters had engaged in "interactive watching". They replied that they had asked Martyn Lewis and Michael Buerk whether they had engaged in such practices, and that they had both made verbal denials to VLC, but were refusing to put their denials in writing.

I can understand that they might think that if they were to make written denials to me, then many other people with my condition might write to them with similar questions. But Ive asked a couple of journalists if theyve been writing about me, theyve made written denials, Ive believed them, and I have not put their denials on my website because, since I believe their denials, it would not be relevant to publish them.

To me it looks as if Lewis and Buerk are happy to lie verbally but not in writing, because written falsehoods would place them unambiguously in the wrong, whereas they can try to talk their way out of verbal lies if they are ever caught, or perhaps even deny the verbal lies completely? If they lie without shame, then why would they have any shame about future lies about lying?

One of the strangest aspects of "TV watching" is that Buerk and Lewis have convinced themselves that their "interactive spying" is reasonable behaviour. Martyn Lewis thinks of himself as a "gentleman". He expressed in 1992 that he was "on my side". If this matter ever comes out into the open, I wonder what these newscasters will have to say for themselves, and what the British public will make of their behaviour?

Media Persecution Evidence on my Website

You may directly access the Evidence section on my website at URL;

The category currently contains four video segments, a number of audio files and three published articles. The first video of ITN's John Suchet is unfortunately a mistake - after looking at it again it is obviously not about me. The two Ken Clarke excerpts may or may not be about me; it is funny that he should keep on harping about "paranoia" and "madness", but I have given these ratings of only 30% certainty, as it is more likely that they are not about me in particular, and Clarke is simply displaying the normal prejudices against the mentally ill found in much of society.

The piece I find most interesting is the Dimbleby/John Major interview from April 1997. I have assigned this a 90% rating. Dimbleby starts by emphasising a report from the "Knutsford Guardian". Major recognizes what's going on and joins in with a falsely apologetic "heaven forfend". The emphasis is on the first syllable pronounced "nuts" in "Knutsford", which is repeated three times. Of course this is hardly anywhere near convincing evidence; the really clear items were all in 1990-92, and they are basically unobtainable now.

If you're reading the website, have a look at the two files from David Hepworth's programme on GLR radio. The first one from 21/Feb/1997 has him talking about an "embarassment" of prizes and "absolute obscene", in reference I believe to the verbal sexual abuse that was being used against me at the time (and which unfortunately is still current). In the second file dated 9/May/1997 he again talks about "absolute embarrassment" of prizes, followed by laughter. To my mind he knows I am listening to his programme, and deliberately makes these remarks for my benefit, with very little attempt to disguise their purpose.

Bernard Levin - "Fanatic's Fare for the Common Man"

On 21 September 1991 this article by Bernard Levin appeared in The Times. It is reproduced in the Evidence section of the website, or may be accessed directly at URL;

To my mind, Levin's article described the situation at the time and in particular a recent meeting with a friend, during which I for the first time admitted to someone other than my GP that I had been subjected to a conspiracy of harassment over the previous year and a half.

Levin writes about a "madman running loose about London" who "bursts into tears, and swears it is all true. And it is." I am pleased to agree with his assertion that "it is all true" because the truth is what I presented to my friend in September 1991 and it is what is being presented to the readership of these articles now.

Conclusion

The harassment, in particular media persecution, was at its strongest in 1990-92. Today, I am recording everything I watch, read and listen, and the media have pretty much given up. It is now incidents "in public" which make up what there is of MI5s persecution. But much of the material from 1990-92 still exists in archives, although the organisations which have those archives generally wont make the material available to the public, for copyright and other reasons.

MI5 can no longer employ the media to persecute me, partly because journalists now know who is behind the persecution, and also because I would publish any instances. My mistake during 1990-92 was to not record instances as they happened; Ive learned from that mistake, and know better now.

Small Parts, Inc in Florida carries Aluminum sheet, as well as K&S Engineering/Metals.

Most well stock hobby stores (R/C models, model RR, etc.) will have that in stock!!

"MARTHA" is a unique circuit analysis software package that was originally developed at MIT in the early 1970's. Rather than a "canned" analysis package that only performs pre-programmed circuit analysis operations, it is a circuit-description extension to the APL computer programming language. It will perform analysis of linear networks like other CAD packages, but by coupling it with APL, it can be used to perform custom analysis and synthesis of circuits that are difficult or impossible to do in other CAD environments.

MARTHA was originally marketed as a mainframe time-share product. It was used at MIT for teaching circuit theory, and by engineers at MIT Lincoln Laboratory to design RF & microwave circuits for radar and communications satellites. Lincoln Laboratory used the capabilities of MARTHA to create circuit synthesis programs (mostly for microstrip and LC filters), in addition to expanding the analysis capabilities of MARTHA.

MARTHA never caught on as a commercial product, but it continued to thrive at Lincoln Lab even after competing PC products like Touchstone became available. MARTHA and the other Lincoln software were ported to the PC, and additional features (like better graphics) were added. All of the Lincoln software was cleaned up and documented to create LLAMA (Lincoln Laboratory Advanced MARTHA Applications), which is still in use today.

MIT Prof. Paul Penfield (MARTHA's original author) and Doug White (prime mover behind the LLAMA effort) have obtained permission to release MARTHA, LLAMA and the associated manuals into the public domain. The initial release is set up to run using a free DOS-based APL interpreter. The APL section of the web site includes this software, along with installation instructions and documentation on using APL. Additional information and all of the necessary files are available at the web site:
 http://www.marthallama.org.

MARTHA is NOT for everyone. It doesn't have fancy schematic capture or PCB layout features. It also requires learning at least a little about the APL computer language (which could be considered a worthwhile exercise in its own right). There is no canned installation routine that will magically get it all up & running on your computer, but there are procedures & batch files to try to make it as painless as possible.

Doug White

Hi all,

I have just released a new site about low cost soldering techniques
http://SuperSolderingSecrets.com

It's a set of videos intended for hobbyists and small companies.

There is a free membership with 5 videos on hand soldering quad flat packs.
There is also a "gold" membership with videos on "toaster oven soldering",
"frying pan solder pot soldering", removal of flux residue etc.

Cheers,

Anthony Burch

Thanks to you and to Prof. Penfield for your work in making these programs available to us. I'll set aside time to do a proper installation (the web pages make it sound like I'll need to pay attention to what I'm doing...). This is kind of a "blast from the past." I recall using MARTHA a few times back around 1972 on our APL terminal. We also used APL for exactly what your web pages say it's good for: quick development of what in Fortran of the day would have been ugly, since we had problem statements already in matrix form.

Cheers,
Tom

Hi all   I need an XR-215 PLL chip.

I would be grateful if anyone has supplier information. Have searched
on google with no result.

Say HI to Paul for me.  He was one of my instructors in VI-B at MIT,
and I knew him later as a board member of GenRad.

Marcello,

Talk to Squires Models & Craft Tools, 100 London Rd, Bognor Regis,
West Sussex, PO21 1DD. Tel: 01243 842424, Fax: 01243 842525

They have:

Brass sheet, 4" x 10" X 0.005, 0.010, 0.015, 0.032, inches thick

Copper sheet, 4" x 10" X 0.025 inches thick

Aluminium sheet 4" x 10" X 0.016, 0.032, 0.064, inches thick.

Sorry, I will leave you do convert to metric :)

I think that you will find this kind of material at any decent model shop.

Rapid Electronics, www.rapidonline.com , has aluminium sheet 0.5m x 0.5m x 0.8mm & 1.2mm, also 0.1mm brass sheet x A4 or A3.

Charlie.

Why do you think all this is so "secret"? My assemblers do all you
mention as well as LGA chips and BGA and all using lead-free solder.
Can you do that?

Paul

Hi everybody, I now owned a magnificent Sansui AU-6900 with its tuner
TU-5900. Wow ! WHat a kit. Damping factor 80 !!! But.... I have a
problem on one amp side. I can't adjust bias correctly. After changing
many parts , pre drivers, resistors, I come to the fact that I need to
replace 2 power transistors but I can't find them anywhere in a store
here in Montreal. WOULD ANYBODY HAVE SOME 2SB545A WASTING TIME
SOMEWHERE ? I would give good money for them...

Hi,

If worst comes to worst, it crosses to a NTE88. That might be easier to
find.

Cheers,

--
Gregg

Well this is a discussion group, so the disadvantage of posting on here if you're trying to sell something is that you put the whole topic up for comment!

So why not put forward ideas.

The biggest mistake any beginner makes is to try to solder surface mount components like they are through hole, and many people think you just need a very fine tip soldering iron (which just results in little heat transfer and frustrating soldering by the way).

Your biggest friend is flux, I prefer a flux pen as its controllable. Some people use spray flux but personally I find that messy, though it works.   Flux is such a good friend because it helps the solder adhere. More importantly it gives the solder mobility, which means that you can remove solder bridges between pins just by applying flux and putting a clean soldering iron on.

Always start with larger components. Because if you get it wrong the easiest way of removing larger components (without a desoldering station) is with a heat gun (hot air paint stripper). And this will blow away any smaller components you already have placed....very annoying.

Before you do any surface mount soldering always use the flux pen to flux the pad. If you have a home made PCB its good to abraid the surface with fine emery paper, clean with flux cleaner (a electrical cleaning solvent spray usually has a brush with it) before fluxing, and if you really want the best tin by running the soldering over the fluxed pads with a small amount of solder. If you tin the pads you need to make sure you dont have an uneven surface as surface mount components need to be flat to solder correctly. In this case put more of the trusty flux on the pads...get some de-solder braid, run it around the pads hot with the soldering iron on it, this will flatten the solder again. Usually with a clean pad without tin is fine if you've cleaned and fluxed, but sometimes on a home made bare copper board applying heat to adjacent pins causes the already cleaned pads to oxidise so they need cleaning again.

SOICs: These are easy, they are relatively large pitch. After preparing the pads, put a little bit of solder on you iron, place the chip on the pads, hold it still and dab one corner pin with the iron...this is just enough to fix the device in place. Go to the other corner and dab again. Then run the flux pen over the other pins and solder as you would any component, just use solder sparingly. If you end up with a solder bridge, make sure the tip of the soldering iron is clean, reflux the pins that have a poblem, and move the soldering iron tip down onto the joint and then away across the board. Surface tension and the flux will pull solder from the bridge to the iron. If theres still solder bridging, reflux, clean the iron on the sponge and do it again. The flux is useless when it burns off, so dont hold the iron on the joint for ages...or it wont work, you will get a knack for it...just long enough to melt the solder and a little bit.

Solderpaste method: Solderpaste is available in small syringes and comes with a small tip that allows you to put down a fine bead of solder. I find you need to widen it a little, but if you overdo it you will end up with huge amounts of uncontrolled paste all over your board and you will have to buy another tip. Solderpaste is expensive, but it goes a long way. Frustratingly it also "goes off" and gets unusable after a time and when exposed to the air, so if you havent use it in a week you may find the nozzle blocked, put some tape over the end in an attempt to stop air getting in. Your supposed to keep solder paste in the fridge...though I dont.

On you SOIC, flux the pad, wait a moment so the flux isnt wet, then dab a small bit of solder paste on the pads. Again you will need some practice. Then carefully place the soic the pads, hold and put the tip of your soldering iron on a corner joint. You should be able to run round all the joints now and each pad usually solders without bridging as theres lots of flux in the paste aswell. (the reason for pre-fluxing the pin is that it makes it slightly sticky, otherwise the bead of paste can slide off the pad!).

Using solderpaste and a small heat gun: Pros use a hot air station which can control the heat and amount of blow, and have a small nozzle to direct the blow. If you have access to one of these you turn the blow down low...otherwise the gael wil blow your components off the board. With the component sitting on the solder paste prepared pads just apply heat until the solder melts. You can also use those portable soldering irons with the heat blow option tip, this has a catalyst so there is no flame (you dont want a flame on your board of course).

Soldering larger QFP type devices: You can use the solderpaste and the above method for soldering these too. However, here is a soldering iron method I learned from a guy who re-worked PCBs on a production line.
Prepare the pads with flux. Place the part down, hold it and use the iron to tack down the corner pins. This is important...if you get the 1st tack wrong you can heat it up and remove the component...if you get more than one area partially soldered you will need a hot air heat gun to remove it!!!
Once the part is positioned and tacked, go over the pins with the flux pen. Then take the hot soldering iron (you need a good 25W+ iron with a flat tip for max heat transfer as this method relys on not holding the iron in a fixed spot).
Orient the board with a strip of pins on the right (if your right handed), put the iron on the top with a little solder and then win a smooth movement take the solder tip back and forth (left to right) across the pins as you move smoothly and fairly fast down the row of pins. You will notice the surface tension of the solder and the flux cause the solder blob to move down with the iron. The left right movement allows the solder to move up over the pad and pin, while the movement down the row pulls the solder blob down leaving cleanly soldered pins. It looks like a machines had soldered them.

Now often you will leave solder bridges where the flux has got overheated and stops working, and there will usually be a blob at the bottom of the row...but dont worry. Now reflux the row, clean the soldering iron tip and place the tip on the solder bridge moving it off to the right one the solder has melted. Clean the tip reflux and do again until the bridge is removed. You may have to do this several times if you put too much solder on in the first place.
You can also start with solder paste on the pads (rather than using normal solder), but sometimes I find you can get bridges under the chip if you do this. After doing all the pins inspect with a magnifying glass.
This is how I put down all fine pitch devices, its a knack but can be very fast and clean when you get it sorted.

Small devices like 0602, 0805 components: You can solder these with a soldering iron and tweezers, though it is fiddly. You can to hold the device down with tweezers and dab the end with the soldering iron.
Put solder paste on the pad makes it easier...though I find this frustrating as most of the time the heat moves through the component and you end up with it sitting on the end of your soldering iron tip!
Better to flux and dab a small amount of solder paste on the pads, place the part on the pads (it will stay there due to the tackiness of the paste) then use gas soldering iron on hot air blow (no flame!) to gently melt the solder. Better, use a hot air soldering station with the air volume turned down low.
You cant use a paint stripper type hot air gun for this as there is too much air coming out and your parts will all be blown away!

I hope thats useful. Any one else have tips and tricks for this?

Andy

I know but I really want the original drivers. These NTE are drivers
that CAN replace but doesn't necessarily carry same exact
specifications. I want to still use the other set for the negative
side so I want matched pairs.

> MARTHA is NOT for everyone. It doesn't have fancy schematic capture or PCB layout features. It also requires learning at least a little about the APL computer language (which could be considered a worthwhile exercise in its own right). There is no canned installation routine that will magically get it all up & running on your computer, but there are procedures & batch files to try to make it as painless as possible.

That's interesting that the 35-year-old A Programming Language (APL) is still around somewhere. I learned of it way back when in '72 while employed by RCA Corporation...and getting interested in programming after a very satisfactory and productive introduction to 'LECAP,'
RCA's
frequency-domain version of the original ECAP from IBM.

However, today's desktop PCs have MORE speed, mass memory, RAM storage than any mainframe computer of 35 years ago at less than $1K US new off-the-shelf (today's Fry's Electronics ad had a PC with LCD monitor for $400). We don't really need Interpreter-based high-level languages now. My circa-1979 Apple][+ needed those to work with its fantastic clock rate of a whole MegaHertz and 48 KBytes of RAM! My 4-year-old PC box with 1 GHz clock rate, 100 MHz RAM access rate, 2 MB RAM, and small 40 GB hard disk can handle 50-node SPICE circuits with perhaps 2000 time increments in a couple of seconds...and store the results in a file. <shrug>

Three decades ago the UC Berkeley group came up with SPICE and made the core of that program FREE, no restrictions (source code available for the cost of paper reproduction and mailing). SPICE derivatives are the electronics industry standard today. Linear Technology Corporation has a working, auto-installable, schematic capture enhanced (or manual netlist entry for die-hards) absolutely FREE. "LTSpice" available at Linear Technology's website as a single download. Many commonly-used semiconductor component models are available as part of that. A tube-oriented audiophile website in the UK even has several vacuum tube SPICE models (they call tubes 'valves' - :-) for LTSpice.

As a long-time homebrewer and electronics experimenter (since 1947), a knowledge of programming languages is not a priority to homebrewing; that is a separate subject, interesting in itself, but not germane. A full-blown, working, easier-to-use SPICE derivative that if FREE is more suited (I think) to homebrewers. I've used LTSpice myself, compared its calculations to actual, working hardware and find NO discrepancies.

SPICE derivative programs all allow netlist descriptions of component characteristics in algebraic form plus a shorthand that is common to all SPICE forms for special Models. There is no need to learn FORTRAN (SPICE core's original language) or versions written in C++ (which are available now), or any other high-level language. For my programming needs today, Assembler-level source code for PIC or ATMEL microcontrollers is more germane to homebrewing. Some of those are also FREE.

At least two PCB fabrication companies have FREE PCB layout programs available without ordering any boards. Transferring a schematic from LTSpice to theirs is just a schemtic redrawing task, usually a one-shot task.

I don't mean to diminish any importance of programming languages or any different CADs or CAEs, but, let's face it, APL is an old high-level language. I still have the 100 W American Beauty soldering iron I got in 1948 but it is out-of-date for soldering parts on a PCB now.

I guess the guys that program in perl, javascript, python, lisp, and apl,
among many many others, should just quit? ;-)

Unix is an old operating system, yet it still seems to get a whole
lot of use. APL is the ultimate programmable calculator. It is a

beautiful language that can do beautiful things in a very succinct manner.

Perhaps if you actually had used it, you might think more of APL.

-Chuck

Andy, that's a great writeup and especially graphic as I had just viewed a number of soldering demonstrations freely available on YouTube. Your extensive use of flux was not evident in any of the videos I saw but sounds like a very safe technique.

Whatever. My point was as a homebrewer using a tool as an aid to
building something. SPICE and its derivatives (all individual
'wrappings'
on the Berkeley SPICE core) are VERY FAST. They work for me just
as SPICE works for thousands of other circuit designers, both pro
and amateur (I am both).

Everyone has their 'favorite' high-level language, each one saying
that Their language is the best, most beautiful, and other fancy
sayings, complete with all sorts of academic praises and plaudits.

My new HP-35S isn't as pretty as the HP-32S II which is also on
my computer table and the programming commands aren't quite
compatible. Esthetics aside, I wouldn't trade either one of them
for SMALL programming tasks. What I want are the numbers
from the results so that hardware can be completed. Both do that
very nicely for what I want.

> Perhaps if you actually had used it, you might think more of APL.

Perhaps if you had actually used LTSpice, a FREE download from
Linear Technology and actually built some circuits using the LTSPice
results you might think more of it. <shrug>

Your message appeared in rec.radio.amateur.homebrew and also
sci.electronics.cad. I am replying from homebrew. I'm not a
programmer despite once having several years complementary
membership in the ACM...or teaching myself FORTRAN IV from
Dan McCracken's softcover book on the subject. I have MS
FORTRAN 5.1 package, bought and paid for myself and have used
it for a variety of different tasks...until MS dropped support of
their
product and also of similar products in later versions of Windows.
<shrug again>

If you want to get all arrogant about computer languages, please
remove rec.radio.amateur.homebrew from your message routing.
In the meanwhile I will continue to do my own homebrewing
without going through even-more learning curves of old languages
or old OSs just to be with the 'best' tool. Even the 'best' tools can
make cruddy circuit calculations.

I have, and I think it is a very nice tool. Perhaps the best of the
available spices. But because it is not a free tool (eg. open source)
I have to live with everything just the way that Mike Englehart

wants it to be. That isn't a bad thing, but it is very limiting because
one day Mike won't be there to support LTSpice anymore, and LT will
decide that they haven't the funds to hire some new support, and it
freeze. To cease being supported is to die in software land.

MARTHA's source is open, and because anyone with the desire to
support it can, it will live forever.

So, instead of shrugging about how MS wronged you by dropping support
for an old fortran package, wander over to linux, or BSD, and run
the open source f77 program, along with all the other open source
goodies that have been made available for everyone to use free of
charge.... including some damn nice implementations of programs for
hamradio use.

> If you want to get all arrogant about computer languages, please

Begging your pardon, but you were the one that felt the need to
slam the MARTHA cad program and apl. The announcement you saw was
a simple announcement of a gift to everyone of this package. That
bothered you for some reason, so you felt the need to tell everyone
to ignore it because apl was old, and anything old couldn't be any
good.

He's certainly open to input from users, Chuck -- it's part of his job. No guarantees he'd add something you'd want, of course, but in my opinion Mike is going to be a lot more responsive to the average user than, say, Synopysys would be if you asked them to add something to HSPICE.

> That isn't a bad thing, but it is very limiting because

That's a rather pessimistic viewpoint. Worst case, LTSpice simply isn't developed any more, but it'll then always still be just as good as it is the day that happens.

> To cease being supported is to die in software land.

Everyone and everything dies at some point...

> MARTHA's source is open, and because anyone with the desire to
> support it can, it will live forever.

Oh, come on... open-source software is, if anything, more likely to die than most commercial software because there's usually no profit motive behind keeping it alive. I realize that it's not quite the same in that open-source software, even if "dead," can be "resurrected" at any time whereas that's often not the case with commercial software... but there's plenty of open-source software that's been "buried" for so long now the chance of anyone resurrecting it rather than just coming up with a new "baby" from scratch is remote.

Mike is all aces as far as I am concerned. His level of responsiveness is
very close to as good as what I typically get from open source authors.

No
> guarantees he'd add something you'd want, of course, but in my opinion Mike is
> going to be a lot more responsive to the average user than, say, Synopysys
> would be if you asked them to add something to HSPICE.

Agreed.

I have for many years seen a connection between software's price and
the responsiveness of the company towards the customer:

Synopsys charges a boat load, and they are not very responsive.
LT charges nothing for LTSPice, and is so responsive that I
would not be at all surprised if Mike Englehardt jumps into this thread.

>> That isn't a bad thing, but it is very limiting because

>
> That's a rather pessimistic viewpoint.

No, it isn't!   It is a realistic viewpoint. I have been in this
industry long enough (37+ years) to have seen this happen over and
over again. It *will* happen with every single piece of commercial
software ever written at some point... guaranteed, unless the owner
decides to commit it to the public domain, or open source, like
MARTHA's owner so generously did.

Worst case, LTSpice simply isn't
> developed any more, but it'll then always still be just as good as it is the
> day that happens.

It sure will, and just like good old DOS Orcad, you will have some people
who keep around old legacy DOS systems just so they can use it. I have rather
a lot of software that was written for Windows 95, that is no longer usable
with NT, XP, or Vista. Am I supposed to keep a '95 box around just to run it?

With open source, I just relink to the latest library, and I am back in the
game.

And what if I need to change it? I won't be able to make LTSpice do
anything that it cannot currently do. That is bound to be a problem if
I need to simulate flux-gate capacitors. Or want a better matrix solving
algorithm than Mike knew to choose.

>> To cease being supported is to die in software land.
>
> Everyone and everything dies at some point...

The only way open source software can die is if it gets lost so badly
that nobody can find it. This is unlikely, given the wide distribution
that most of these packages have had.

>> MARTHA's source is open, and because anyone with the desire to
>> support it can, it will live forever.

> Oh, come on... open-source software is, if anything, more likely to die than
> most commercial software because there's usually no profit motive behind
> keeping it alive.

MARTHA has already outlived most any other commercial software that
was written in the same time frame. As long as the source code doesn't
get lost, and *anyone* is interested in it, it will continue to survive.

I have been running a quaint little editor that Jonathan Payne, of Sun
JAVA fame wrote when he was a wet behind the ears kid in high-school.
It was designed to run under unix on a pdp-11 with 64K-I, and 64K-D.
I have ported(or simply used) it to(on) every operating system, and
platform that I have used since he wrote it.

Before jove, I was enamored by a nice little editor called edix. It was
proprietary, and ran only under DOS. It died 25 years ago. Sure, I can
cart its mangy carcass off to linux and run it under DOSEMU, but if I want
to change anything about it I am out of luck.

You say there is no profit motive, but that is where you are completely
wrong. *I* profit from the open source software that I use. As long as
that is true, I will see to it that the software I use is available on
the systems that I am currently using.

   I realize that it's not quite the same in that open-source
> software, even if "dead," can be "resurrected" at any time whereas that's

Odds are pretty good that that new "baby" will have in some way benefited from the
program that came before it. You might not be able to see the connection, but
it is very often there.

-Chuck

Chuck Harris wrote:
> Spice is an interpreter.

SPICE makes sense as an interpreter. Compilers are best for programs you write once and use several times; interpreters are best for programs you run once but write several of. If you consider every change to a circuit to be a separate program you run once (which makes perfect sense when you consider you would be recompiling it every time you made a change), and you consider that once the circuit works to your liking you probably won't be running that simulation often, then an interpreter is perfect for the job and a compiler would be slow and inconvenient.

I would have loved having DOS Orcad; I used to use the demo version
which wouldn't save or print, by using a video printer for output.

> I have rather a lot of software that was written for Windows 95,

Why not run the old O/Ses on virtual machines? I know quite a few
folks who have a boatload of old O/S and apps running under VMWare.

Regards,

Michael

There is an additional, very important reason to use an interpreter:
Ease of debugging. An interpreter knows exactly what is happening in
all of the data spaces, indexes, jumps, subroutines, etc. at all times.
That factor makes it easy to debug. Interpreted languages, such as Python,
Perl, and apl have extensive debugging facilities available. Debugging with
a compiler is a much more complicated matter.

You are in luck, it is available. Check out the OldDosOrcad group on Yahoo.
Even DOS OrCAD's author appears there from time-to-time.

And I am doing just that, with linux and Wine. Wine allows me to run
a windows program as it existed on the day it was written, but does nothing
to help me if I need some changes.

I suspect a lot of these old and free PCB CAD packages are not taking
full advantage of the current PC hardware.

PC's have bags of memory now so the old pin limited packages are out
of date.

Things like vast processing power can be done to do things like auto
placing of components.

In my software I also added right click context menus which are very
user friendly.

That is certain to be true.

Yet another argument in favor of open source.

You're right. In a way that's what one is doing when changing a SPICE
simulation repeatedly while testing/modifying a circuit.

Greetings:

I would appreciate advice on features desirable in a DSP audio processor unit. I have no experience with any modern DSP-equipped rigs and my older radios only have simple xtal filters and IF phasing controls. I never had a useful CW filter on anything (my SB300's 400 Hz filter was broken). At a minimum I suspect that a variable parameter narrow filter, sliding notch, denoiser, autonotch and selectable preset filters would be useful, together with onboard decoding of various digital modes.

My DSP processor adjunct to my homebrew receiver is documented at

http://www.cybertheque.org/homebrew/rcvr/dsp.

It is online for listening according to procedures described on the site. At the time of this posting, the receiver is tuned to a nearby non-directional beacon on 335 kHz (ID is COQ) which ordinarily is un-copyable at this QTH due to extreme noise on the bands below 500 kHz. Using the very narrow filter described on the site, the signal is quite clean. Another reliable CW source without a lot of noise is KA0PSE's beacon on 28218 kHz. Please listen to the wav file of a snipit of a recent 80m CW QSO between N1DZ and PK1VH which was heard in the late evening when 80m is usually closed and very noisy around here (the link is on the page). Not having been active on CW for a long time and never having had benefit of filters, I felt this was eminently copyable, but I would appreciate the advice of others who are active. People have complained in general about 'ringing' or click artifacts in narrow filters; I hear the spectral components of the background noise at this filter's center frequency, but I don't think there is ringing and certainly there are no clicks.

Incidentally, there is a touching description from N1DZ of his grandfather's radio activity in Java during the 1930's at:

hamgallery.com/qsl/deleted/Java/pk1vh.htm+n1dz+maarten&hl=en&ct=clnk&cd=14&gl=us

This narrow filter represents a maximal implementation of a FIR framework within the memory constraints of the platform (4k Data space); only one-half of the available MIPS are used however, which permits the addition of adaptive control algorithms or additional tasks such as demodulation of digital modes while employing this filter's framework. Note that I've coded for the base level of implementation of this technology; more well-equipped MWave DSP cards have up to 64 kB of data space. I've written this filter in the assembly language of the DSP and all processing is done onboard; the host only handles control and status with the outside and serves coefficient and control-data sets to the DSP tasks. The only latency between input and output is the 726 uS needed to pre-roll the input circular buffer.

ALSO:

I would appreciate hearing experiences with PC-based DSP software, including the package name, system details (speed, o/s, etc.), and comments on usefulness, stability, etc. I have yet to find a useful PC-based DSP program that will run on hardware that I own (< 1Ghz, mostly 400 -> 600 Mhz PII/PIII) except for a German collection of FIR filters, which have a long output latency, or the DSP Blaster on DOS using a Soundblaster card. I have tried perhaps a half-dozen programs, some open source, some proprietary, and all have either crashed the O/S (mostly Win2k, or Win95/98 since the majority of programs are written for them), run out of resources (CPU), have terrible broken audio, have huge footprints, use unmanageable installers, require a bunch of MS installs (MSIE, DirectX, database APIs, COM, .NET, etc., etc.) or are otherwise unfriendly. I realize that DSP on a general purpose CPU is going to be resource intensive but with MMX and SIMD it should be doable on PII/PIII. This is really for edification only since I don't intend to use a standard PC for DSP except for testing and evaluation.

Please let me know what you find most useful and necessary in a DSP unit for radio work; I hope to have the remote interface running within a month or so and will then need to add additional filters and demodulators. The entire project will be documented on the site and source code and binaries will be available.

Regards,

Michael

Dual notch. Dual autonotch would be cool.

Posting-Frequency: posted monthly
URL: http://www.faqs.org/faqs/radio/personal-intro/

Changes followed by "|".

The rec.radio.info newsgroup, first established in 1993, has been recently revived by an active moderation team. We are currently seeking suitable information, FAQ, and bulletin articles from the entire rec.radio.* newsgroup hierarchy for simultaneous cross-posting to our newsgroup.

We are seeking a replacement maintainer for the following information bulletin formerly posted to rec.radio.amateur.* (and currently archived at http://www.faqs.org/faqs/radio/personal-intro/):

radio/personal-intro
Subject: Guide to the rec.radio Newsgroups
Maintainer: jeffreyh@Hawaii.Edu (Jeffrey Herman)
Last Posted: 9 Nov 2001 06:18:17 GMT
Posting-Frequency: 15th of each month

We are willing to provide any technical support necessary to get this article updated and automatically posted again at a regular interval. This would include establishing contact with the original maintainer for any necessary permissions. We would prefer to seek a new, dedicated maintainer at this time, rather than start auto-posting the original article ourselves.

For more information about our newsgroup, see:

http://www.panix.com/~rram/usenet/rri/index.html

Please direct any comments, questions, or criticisms to
rec-radio-info-request@panix.com.

If you think that having the original transistors will keep the "sonic purity" (is that the right phrase? - bit out of touch with hifi voodoospeak) of your amplifier, theres no hope for you - at least, not in a science/technology oriented group.

I too like Sansui amplifiers - the last one I had, I stripped it down, got a grunty,high current power supply for a AM transmitter I am making....nice big power transformer, big can electros on each rail...cut up the chassis to make it modular for future projects. Used the heatsinks and some of the output transistors for the modulator amplifier. Sundry resistors etc, and the nuts/bolts/screws helped with the hardware.

And it was working, but the AM transmitter project was MUCH more
interesting....

Andrew VK3BFA.

Well, your in luck - went out to the workshop, checked the plastic
crate holding the unused bits of the stripped Sansui amp. Got at least
2 of the 2SB545A ,possibly more - will check, but can guarantee two of
them...- no idea if their matched, I didnt pair them when I stripped
it (wanted to cut off a piece of the original TO3 mounting plate to
machine a heatsink bracket for the new modulator amp, but then its
highly unlikely Sansui matched them anyway - they are from the same
batch though...) And it was working when I stripped it down - got
enough audio stuff here anyway, so it was no great sacrifice...

Give me your postal address off group, will send them over to you.
When you get them, send me some American dollar bills for the marked
postage cost....mark the email 2sb545 so I dont spam it...

And yes, was stirring you re the amp - as a working tech, its common
to do transistor substitutions for unobtainable parts.....and I think
Canadians have a reasonable sense of humour........

Andrew VK3BFA.

It may be - but the American "Green Stamp" is still a universal
currency, useful for getting QSL cards....

Andrew VK3BFA.

Thanks, will try.

On the other topic, anyone have _any_ experience with general-purpose PC DSP software?

Michael

I am looking for information on a 3 tube 75 meter am transmitter that was around about 1958. Two of the tubes were 6146, one for modulator and one for final. I cant remember what the oscillator was.

I see nothing close to your description in the 1957 ARRL Handbook -
in either the "Mobile Equipment" section, nor the "HF Transmitter"
section.

Or, are you referring to a piece of commercial gear?

There was no osc. buffer, and no mic. preamp?

```
     (I did run across an ad for Burstein-Applebee.
      Now, _that_ *really* brings back memories!     )

Rough and ready. One inch is 'about' 25mm?
So 0.5 mm = 1/50th of inch?
```

Which = 0.02 inches?
That correct?
So 0.016" would be close????????????

Yup, good memories...
However, ARRL was not the sole source of info... I vaguely remember a
quick-n-dirty mobile AM with 3 tubes...  But, why worry about what was
published then.. We can cobble up something similar today on our
own... Use a VXO for the vfo oscillator to make it stable under
modulation peaks...   Use screen grid modulation...  Won't need a 6146
for the modulator, a 12AX7 should do (I'd have to research that, so
don't take it for gospel)
OTOH, the nice nursey says I need to take my pills now...

>I suspect a lot of these old and free PCB CAD packages are not taking full advantage of the current PC hardware.

Possibly true, although I can comment that "PCB Artist" which is the free PCB package Advanced Circuits has wouldn't fall into that category: It's really a version of EasyPC (from Number One Systems / WestDev) in disguise, and quite sophisticated.

> PC's have bags of memory now so the old pin limited packages are out of date.

Pin limiting has, in the past decade or so, always been a means of artificially restricting users based on how much they were willing to pay for a license and has nothing to do with not taking advantage of the hardware.

> Things like vast processing power can be done to do things like auto placing of components.

I've yet to see an auto-placer that's worth using, but I'd admit that I haven't used yours.

> In my software I also added right click context menus which are very user friendly.

Most Windows software did this around 1995-2000...

(Of course, there's still overpriced stuff like PADS out there that TO THIS VERY DAY cannot be installed in a directory that has a space in its names... like, oh, say, c:\program files...)

He did say .5 cm. So did the web page he was citing. It's pretty clear from looking at the picture of the capacitor that .5 cm is out of the question, and must be a typo on the original web page, while 0.5 mm is quite reasonable for a capacitor of that construction and size.

The post has been out there a while and we all assume it's a typo (I've never seen the original poster reply about that) but 1/2 a centimeter would make HUGE plates...1/2 a mm sounds MUCH more realistic...

I do not remember a 3 tube transmitter using 2 6146 tubes. I question that arrangement, because the 6146 modulator would be running class A and very inefficient.

However, I am familiar with a 2 tube transmitter using a 6146 final. It was very effective and a lot of hams built one. It was called the "Golden Gate" circuit, because it was popular in San Francisco.

Using1/2 of a 12AT7 for a crystal controlled oscillator, driving a 6146, it was screen modulated by the other 1/2 of the 12AT7. Used a carbon mike and step up transformer.

It appeared in the "New" CQ Mobile Handbook, second edition - 1956.

Advanced Circuits will sell you 3 PCBs up to 60 sq. inches on a 2-layer board
for $99 (http://www.4pcb.com/index.php?load=content&page_id=130) ... if you
can de-panelize them yourself, it might be cheaper that way.

> 3) I'm not doing this for porfit, Ham radio is my hobby not my job, so
> anything boards I make I will either give away, or sell at cost.

If you're going to sell them anyway, I can't imagine anyone will protest if
you tack on something extra to begin upgrading your software or hardware. :-)

I've got a number of small 10.7 Mhx FM bandwidth crystal filters I want to dismantle to recover the crystals for making a narrower bandwidth filter.

What is the best way to open the can? I have a small butane torch which I could use to try and melt the solder the joint around the perimeter of the base of the can, but I don't want to harm the crystals.

Does anyone have any experience of this, and would I perhaps be better
to hack the end off the can, and get into it that way.

Thanks de miken,   zl1bnb

Miken

Some of those FM IF filters used cascaded monolythic two-pole filters
with small matching capacitors between the sections. It may not be
a lattice filter like I suspect you are anticipating.

I've opened those cans by heating the seam with a large iron, just enough
to get a small screw blade started to gentle prying the seam apart.

Regards

Peter

1. I've been digging around in the receiver of my Yaesu FT-817ND
transceiver and simulating with LTspice the AGC and AM detectors to
investigate possible distortions due to non-linear loading of the IF
feed they share with the SSB/CW product detector when I chanced upon
an unexpected behaviour: the envelope of a CW IF signal at the input
of the product detector is amplitude-modulated by the beat frequency
output. The modulation is asymmetrical and distorted and is perhaps
only 5-10% deep but its fundamental component is clearly the beat
frequency. I presume that the output is therefore distorted to the

extent that the output amplitude at any time is somewhat proportional to the amplitude of the input envelope. Is that a reasonable supposition?

2. I suspect the cause is a dynamic load impedance of the product detector being fed by a high impedance IF source - a 100pF coupling capacitor (approx 3600Xc at 455kHz) preceded by an IF buffer amp with at least 1000R source impedance. The product detector is NJM2594, stated in the datasheet to have a 600R input resistance and schematics for test setups showing 50R sources. Is that a reasonable explanation? Are there any other probable causes?

3. If the hypothesis in 2 is correct, a probable solution would be to lower the source impedance and that of the coupling capacitor to something on the order of 50 Ohms. Is that a reasonable conclusion? Are there any other possible solutions?

I've posted an article to the Files section of the FT817 Yahoo!Group:
http://groups.yahoo.com/group/FT817/files/Audio%20Distortion%20-%20Receiver/Beat_Modulation_of_IF/

Thanks Peter for that advice.

I dug out the 100watt Solon iron I picked up at a flea market about three months ago, and followed your suggestion with a little bit of trepidation; it wasn't too difficult at all.

These filters have 4 crystals in a lattice configuration, with interconnecting capacitors and matching inductors at each end. The crystals are mounted on a small FR-4 pc board, which would seem to insulate them from the heat input into the can, so I doubt they would be heat-affected.

It seems to me that the filters with a casting resin filling in the base, rather than with a metal base soldered into place are more likely to be monolithic filters.

I'm sure I'll have enough to make the filter I need (for a Pic-a-Star).

Next step is to determine the crystal characteristics.

Interesting that your posting should come just at this time. Perhaps a week ago I was looking at a Spice simulation of a mixer to baseband: really just a product detector. I noticed the same effect, and concluded that it is indeed due to the change in effective load impedance.

However, I do not believe that makes for distortion, directly. If the source is linear, the loading that depends on the relative phase between the LO and the IF signals does not cause distortion, just modulation. On the other hand, if the source impedance looking back into the IF is not constant with varying load, there will be distortion.

If my analysis is correct, then there is not a need to prevent the modulation of the IF output amplitude, at least not for the reason of preventing distortion. A way to check this would be to put in two signals and check the output for intermodulation products, or to just check the sinusoidal output (appropriately filtered to remove high frequency components) for harmonic distortion.

I'd be interested to know what more you learn about this. I may do some playing with it myself, since the answer may matter quite a lot to something I've just started working on.

Cheers,
Tom

If they (each crystal) has three leads in a row, then
they are likely to be monolythic filters. Especially
if they are have small value capacitors between each
section to ground.

15kHz BW in a ladder design is pretty hard to do in
my opinion.

cheers

Pete

Not likely to find one as the Heathkit computers prior to the
PC world (other than the H8) used hard sectored disks. I can
not remember the last time I saw a 5 1/4" hard sectored drive!!

Interesting! I could find no Spice model for the NJM2594 and, as I was
primarily concerned with the always connected AM and AGC detector
diodes and their distortion of the IF envelope as seen by the product
detector, my LTspice simulation merely uses the special Modulate
function as an ideal p.d. It has effectively an infinite input

impedance so I do not see the beat modulation in the simulation.

I agree with your point about testing; sadly, I lack the equipment to
do so. I have one rather poor RF source - an old B+K function gennie -
and my notebook computer for audio analysis. My old Eico tube
oscilloscope does not readily show any distortion of the beat output -
it may not be easily discerned visually anyway without a reference
sine wave superposed or subtracted.

I'm not up-to-snuff on the math of this but I'm inclined to think that
amplitude modulation of the input envelope at the beat frequency,
however caused, should result in a distortion of the output beat
frequency signal that would not be present if the envelope was a
constant. Amplitude modulation at any other frequency would result in
a second beat note in the LPF output. I'll have to noodle about this
some more and see if I can come up with some test.

73, Tom VE3MEO

Hi Tom,

Well, you can simulate it and see if you get distortion in the
output. You can create a "product detector" using just Spice
switches, switched at the LO frequency. My model, which I haven't
gotten back to yet since seeing your orig. posting, is of a Tayloe-type mixer, but I would not be at all surprised to see the same effect
with other configurations. In LTSpice you can do an FFT of the output
results to look for distortion products, but if you want to look at
really low distortion, you need to subtract out the fundamental(s);
I've seen a limit of around 80-100dB dynamic range (as I recall).

I do have equipment to test for distortion. I may be able to do some
of that this afternoon. I'll let you know what I find.

Cheers,
Tom

I cannot remember any differences in the drives, only the media.
The sector holes and index hole were all on the same circle.

I used to use a cheap punch to make hard sectored
media and IIRC, I just lined up the punch on the index hole
and then rotated the media a certain number of degrees, punched,
repeated, until done.

Here is an excerpt from a website that describes drive and media
specifications (http://www.retrotechnology.com/herbs_stuff/drive.html):

> Facts on hard sectored diskettes and "drives"
>
> 1) Hard sector means that the DISKETTE (not the drive) has multiple holes,

ExpressPCB will sell you industry standard Gerbers of artwork generated
by their free software for $50, as I recall.

BA984 LHR->TXL 13/June/1998

Certainty level: 100%

In June 1998 I travelled on the above British Airways flight to Berlin with my mother, to visit her family. There were two women in seats 30D/E, about 4/5 rows behind us. It was quite obvious from the torrent of abuse during these flight that these women had been instructed to harass me and attempt to obtain a reaction.

I did manage to record much of the flight, but unfortunately much of the recording is unclear because of high background noise on the aircraft. The following three excerpts from the recording are the best I can do.

The segment at position 11:34 minutes on my recording contains a fairly quiet word "paranoid", followed immediately by a much louder
"yeah, he's paranoid, yeah". During the flight the abuse was not sexual, as it so often is elsewhere, but attacking my mental health.

One of the women in seats 30D/E said "paranoid" very clearly towards the end of the flight, but unfortunately I had run out of minidisc space and stopped recording by then. There is absolutely no doubt in my mind that these women were directed to harass me. This harassment happens without fail on British Airways flights; I've been on something like three or four BA flights in the last 5 years and it's happened each time. Presumably this is because of international law which says incidents on aircraft during flight are actionable in the airline's country of origin - so my persecutors want a reaction from me, and they want to see me "done" in the UK where they can influence the justice system.

These incidents never happen on foreign-domiciled carriers.

Perhaps M3OSN's obsession with attention-seeking infantile remarks
within these fora is analogous to Nero fiddling while Rome burns?

That the RSCB is a shambles in the background while the directors are
forever spin-doctoring shows up a parallel with the Labour misgovernment?

In any case, is it not a matter of fraud if a contract exists to send a
publication
and they refuse to correct their oversight?

Evil old bat in BHS 18/12/98

Certainty level: 40%

Not quite sure how sure I am about this one. I went down to Croydon (Surrey) with my mother to buy her a beret. After doing the shopping, we went to the BHS store restaurant to lunch on fish and chips.

You can guess the rest. Auditory hallucinations my shrink calls them, faithfully recorded on Sony minidisc. Some old cow going on about "see that chap, the one over there, something's wrong with him".

It is quite tiring being attacked by random idiots in the street, or as in this case, by some random, evil old bat in a restaurant. Fortunately it is only a sporadic occurrence. My enemies seem of late reluctant to waste resources in my direction. Should I take this as an insult? Am I not worth the millions of taxpayers money which has been wasted on me? Are the obsessives of MI5 themselves the "nutters" and "really mad" which they accuse me of being? Interestingly this suggestion as to the psychological profiles of Security Service personnel has been made by others... it does lead one to wonder, doesn't it?

Ravenscourt Park 20/3/99

Certainty level: 70%

On Saturday I went to Hammersmith, specifically Ravenscourt Park. There had recently been a resurgence of persecution activity, following the Capital spams. I went to the cafe in the park and had a cup of coffee outside, with my mother. As I went inside the cafe to return the cups, a woman shouted a sexual obscenity (not present on this audio file - don't ask), and she said loudly "something's wrong with him". You can just about hear it in the audio file; listen very carefully, several times; it is distinguishable.

Much less subtle is the male voice shouting "take care he's a nutter" immediately after the woman's voice. As on the other recordings there's a lot of noise, but what the people say can be clearly heard.

Given that I take medication and look and behave quite sanely, and that there had been increased abuse over the last couple of weeks, it seems pretty unlikely that this incident was just spontaneous.... of course, you couldn't prove otherwise, but then that's the way MI5 mean their abuse to look.

Battersea Library 29/3/99

Certainty level: 60%

This one is quite dull. During the month of March 1999, MI5 made another determined attempt to "get" me, substantially through radio programmes, through Jon Snow on Channel Four News, and through abuse in public, of which this is one example.

Recorded on my minidisc-walkman on Monday 29 March 1999, this audio file consists of two girls talking. One says to the other, "he's got something wrong with him." The usual words. How many millions a year do the Security Service waste on this? But they've denied it - how silly of me to forget. And they're not liars either, are they?

Royal Festival Hall 15/4/99

Certainty level: 100%

Another "day in the life of", this one. January and February were quiet; in March it all started again; by the middle of April the resurgence of abuse had been going on for over a month. And this, with 100% certainty, is one manifestation of the abuse.

On Thursday 15 April 1999, 1pm lunchtime, I was at the booking office at the Royal Festival Hall near Waterloo Station in London, buying a ticket for a friend. A woman was at the counter next to me. She said;

"it would kill it, you know, it would just be overkill...
.. they can't stop can they"

It was obvious to everyone, the ticket agents included, that her comments were directed at me, and that "they" (ie. MI5) were "killing" me.

I've heard similar things said at various other times, but rarely have their intentions been expressed as clearly as this. The woman also expressed the obsessive nature of MI5's preoccupation with me, by saying, "they can't stop can they".

Balham - LT bus (8/July/1999)

Certainty level: 90%

I am very sure about this one. I got back from holidays on Wednesday. There were two incidents, both on the tube, on the way back from the airport. There was a further incident the following day, Thursday, on the bus (the 155 I think) in Balham, where two girls started spouting abuse about "crazy", etc. Naturally I had my minidisc with me and was able to record their words.

The cynical reader might think my demeanour or behaviour had given rise to the taunts of "crazy" recorded above. But I assure you my behaviour on the bus would not have made anyone think I was ill; and the taunts the previous day were the same sexual words as previously; so I'm quite sure that these incidents are either deliberately staged, or indicative of an overall high level of awareness among the London public, particularly in the part of London where I live.

Clapham South (17/Feb/2000)

Certainty level: 100%

In February 2000, MI5's hate campaign against me was in full swing. They sent people into the road where I live in south London, to swear at me and abuse me as I was leaving or returning home. One such instance is recorded on the above audio file.

On Thursday 17 February 2000, I had just left my home, en route for Croydon, when two youths approached, going in the other direction. One of them said with a smile on his face something which I didn't recognize, and still don't understand despite it being on this audio clip. His demeanour made it clear his statement was directed at me. I coughed, and in response to that, he continued his insult, calling me a "wanker", which is very clearly recorded on this audio clip.

Two days later, in the very early morning of Sunday 20 February 2000, MI5 inflicted another insult against me just outside my house, when, returning from Croydon, two youths approached (MI5 agents always go in packs of at least two - they're too cowardly to go anywhere on their own) and one of them said quietly and bitterly to the other that "he's shitty, very shitty".

It is still comparatively rare for MI5 to send people to my house, or to my road, to harass me. Usually they know where I'm going to, since they have bugs on my phone and in each room of my house; and they send people to that location, or on the train or tube getting there.

Clapham Junction (6/May/2000)

Certainty level: 60%

On Saturday 6 May 2000, I was in Clapham Junction, shopping and visiting the library. At precisely 12:29pm, the above audio clip was recorded, in front of Arding and Hobbs department store. One girl was saying to her friend,

"He's a homosexual, they can say whatever they want."

There are several reasons why I think this comment might be about me. Firstly, temporal proximity to other such incidents. The persecution had restarted about two to three days before this clip was recorded. Cause of restart unknown. Personally I think it's because I was going on holiday to France the following Monday - MI5 do like to take holidays abroad at the taxpayer's expense, and inventing reasons to resurrect their hate campaign just before I go on holiday is something they've done before.

Secondly, although I am not gay, they have used such references against me before. At Oxford Computer Group in 1994, manager Steve Mitchell simultaneously abused me and another employee but saying we were "of a similar bent". Such insults show latent or quite overt homosexuality on the part of the abuser.

Thirdly, the sort of people who abuse on the basis of mental illness are the same people who abuse others on the basis of sexuality, race, religion, etc. If they can abuse a disabled man, then they will surely do so based on the other criteria mentioned.

There is still some room for doubt, though, which is why I have assigned this recording a certainty level of only slightly above evens. But "they can say whatever they want" is what gives the game away; they just choose a differentiating feature on which to base their abuse; and if one such feature gets too boring ("we've called him a nutter for the last ten years so now we'll call him something else") then they invent a different lie to throw at me.

Balham High Road (3/Nov/2000)

Certainty level: 60%

On 3 November 2000, I had just got off the bus in Balham High Road,
when I heard a group of schoolgirls shouting and laughing. One of them yelled;

"He's an idiot you know."

You can hear this on the above clip; it is followed by laughter. I am
not quite sure this is about me, which is why I have only given it
a two in three probability. I have been attacked many times with the
word "idiot", which seems to be a favourite with intellectual lightweights
who want to bring down bigger game. (Back in 1992 I was so worried by the
attacks on my intelligence that I took the test and joined Mensa......
does that make me a *clever* idiot? Never mind.)

Crescent Grove, Clapham Common (2/Dec/2000)

Certainty level: 100%

This is one of those clips where I am absolutely, 100% certain it's inflicted by MI5 on me, because of background, context. On Saturday 2 December 2000, I was walking from my home to a pub on Clapham Common, and on the way was in proximity to a group of three English youths who were walking the other way. They turned from the main road into a private estate called Crescent Grove. Here is what they said;

(first youth) "He masturbates!"
(his mate responds) "Yeah, he masturbates!"
(and again) "Thief!"

There is a lot of context associated with this incident, which I will now relate.

Firstly, the verbal sexual abuse is a popular one with MI5, and as a statement about me is currently mostly in their imaginations. The accusation has to be seen relative to MI5's persecutory actions in late November and early December 2000, and in fact for some months leading up to this. Their relevant activities in June 2000 are documented in a message in this evidence item;
following from that, they sent someone to simulate an act in front of my window, which was captured on film.

It is the publication of the video of their agent performing the act on himself which caused MI5 to restart this thread of harassment in the first few days of December 2000. But there are some subtleties; I uploaded the digitised video to this website on 26/November/2000; but I did not announce its existence on the newsgroups until Sunday 3/December/2000. These youths' slur was made the previous day, on Saturday 2/Dec. That tells us quite a lot. According to my website logs, there were no accesses to the video file before Sunday 3/Dec. So why did MI5 restart this particular thread of abuse, before their agent's activities were published on the newsgroup? The conclusion we reach is that they were watching my internet connection, either decoding the telephone line, or at the ISP; and/or they may be able to physically see what is on my notebook computer's screen, from RF transmissions from its VGA circuitry. I do not know whether the latter is technically feasible, but the former certainly is, and I have known for years that MI5 bugs my internet activities and phone calls. It is from their observation of my internet connection that they were able to tell, without accessing the video file over the net, that it was of their agent in a compromising position; and it was from that observation that their shouted slur on 2/Dec emanates.

The second accusation, "Thief!", is even more interesting. It relates to occurrences from June of 2000, some six months before these youths threw the word at me. It shows just how wide in reach geographically and temporally the MI5 persecution is; they react to something which happened half a year previously.

In the first half of 2000, MI5 made a determined assault on my friendships. In one particular case, that of A. whom I had known for virtually all my life, they partly succeeded. This person made pointed references to me which made it clear he knew what was happening; at one point he started asking "do you know anything about the FBI and the CIA". In June 2000, we went to see a film in the West End. I paid for both of us, and then asked him to return what I had paid for his ticket, some �7.50. He was reluctant to do so. Eventually he returned �5, settling for the lesser gain of �2.50.

I did not call him a thief to his face, but I may have spoken the word while I was at home, either conscious or in my sleep. MI5 have very tight control over everything I do and say in my home through their bugs; if I say anything against someone in "their" camp, they turn round the accusation against me. So, from the fact that A. tried to garner a few pounds at my expense, MI5 create the accusation, six months later..... "thief!".

Virgin Radio-Jon Holmes (4-5/Jan/2002)

Here are two segments from Virgin FM, one on Friday, the other on Saturday, both from the Jon Holmes evening show.

Certainty level: 80%

In early January 2002 I listened for the first time in some months to Virgin Radio, specifically to the Jon Holmes evening show on Friday 4 January 2002. They promptly attacked me verbally. Again, context is relevant. There are three instances in the space of two minutes on this extract;

00:18 "are you lying?"
00:22 "it's not fair"
01:24 "everyone at the amateur c+ turbo programmers club found it hilarious"

The first phrase is a straight slander. MI5 were trying to portray me as a liar at around this time; I have other audio with the same accusation. "are you lying?"; unsophisticated.

It's closely followed by the words "it's not fair". Note carefully the way he says it,
quickly, as if to deny what he says. The phrase "not fair" was first created by OCTS MD
H S.-W. in Nov/1992, and picked up on my first visit to hospital soon after
"they should have paid your fare").
Again, unsophisticated parrotting of a key phrase.

The third phrase is explicable through contemporaneous context. That morning I had
phoned about a C++ course. "c+ turbo programmers club"... again, somewhat brazen
we're-listening-to-what-he-says-on-the-phone, and he-can't-prove-it. Something got lost
in translation from MI5's watchers to Virgin, because "c+ turbo" means nothing.... there
is no C+ turbo language, only C++, of which Turbo C++ is one implementation.

Certainty level: 80%

I wasn't entirely convinced from Friday's programme, but the following evening's
show confirmed it. It contained a number of references to my condition, of which the
following excerpt is one such;

00:09 "I'm not well, and no-one cares"
00:24 "my voice sounds all funny"
01:01 "do you mean people that aren't mad"
01:05 "medical problem is it"

"I'm not well" doesn't mean he has a cold; it means he is being sarcastic about my
mental illness. "my voice sounds all funny" refers to the change in nature of my
voice when acute illness hits. "do you mean people that aren't mad" is obvious.
"medical problem is it"..... rubbing salt into the wound.

Balham Hill Post Office (14/Nov/2002)

Certainty level: 80%

By mid-November 2002 the persecution had again dwindled, as happens sometimes, when along came this item.
I spent most of my time at home, going occasionally to the shops in Clapham South, or into town to meet people. On this particular
Thursday I only left the house once, for less than fifteen minutes to post a letter (special delivery, because my ordinary and
recorded delivery letters had been disappearing en route for some time - not that anyone would accuse MI5 of such petty harassment).
At the post office counter there was an Asian guy talking into his mobile phone and grinning away. There is a probability that
his comments were directed at me, as I will explain further. The second segment of audio closely follows the first segment.

"you'll do it today? let's meet about 3 o'clock and have some lunch. I got stuff to do and I'll go to the bank,
get this sh.. fucking moving yeah. Even just a little bit do something. He doesn't understand, you know what it is,
I don't want to tell him again cause then he might, he thinks we're having a go at him, I'm not having a go at him,
I'm explain to him"

Explanation: The guy is talking about some bloke who is unnamed, however it might be interpreted as being in code about me.
"I'll go to the bank"... variously interpretable, either literally, or as sounds-like "wank" which has been a consistent
theme in MI5's abuse. "get this shit fucking moving"... abuse... could be interpreted as MI5's criticism of my inertness.
The state spends hundreds of thousands of pounds a year - they want to see some result, not just neutrality and ordinariness.
"he doesn't understand"... MI5 claim I'm stupid... but the numbers and bits of paper prove otherwise, so perhaps what that

is really about is their agents' subconscious perception of themselves.

"having a go at him"... sounds like they're having a go at me, doesn't it? You might take the audio at face value and assume it's about some other guy, but it's normal MI5 procedure to pretend to be talking about someone else, and make the content of the message very relevant to me, or their perception of me.

"for some reason it doesn't get into his head, I don't know why... he's lost it completely, hasn't he"

What reason is there for it not getting into his (my) head? Stupidity is implied. Also implied is that it does get into his head; we're intentionally causing him damage. He's lost it completely... for some time I have suffered from OCD... lost it completely is the persecutors' observation of my illness, which they see through the surveillance on my home, which they caused.

Eclipse pub in Balham (20/Dec/2002)

Certainty level: 70%

On Friday 20/December/2002 I went to Balham to do some shopping and eating. When I went into the Eclipse pub for a meal
there were two girls already at the bar being server, I ordered and sat down near the window. They sat down at the opposite
window seat, out of sight. After a few minutes they started screaming repetitively "section, section". They were reading
something and were trying to pretend that they were just repeating from what they were reading, but in reality it was quite
obvious they were talking about me, specifically to confinement under mental health.

As you can guess the behaviour of these unwise young things shows them to be from the underprivileged category which due to
the natural laws of society is seldom seen in the better classes of restaurant - the McDonald's next door is their more
usual habitat. My guess is that these two females were deliberately placed in the Eclipse with orders to be offensive to
me personally. The alternative would be that no-one had ordered them and they were just being rude on their own account,
but that is improbable, for two reasons; first, I was out of sight of them and one does not usually "pick on" a person
one cannot see; secondly, there had that afternoon in Balham been other, less distinct incidents immediately preceding this,
and it is inferable that MI5 were making quite a serious effort to create a physical incident, as they have done on
numerous occasions previously. I give my interpretation a two in three chance of validity.

Barbican Library - 6/Feb/2003

Certainty level: 100%

Here's an item from early February 2003, at which time Security Service were re-igniting hostilities against me, a direct result of my appeal
for a legal hearing against their organisation. On Thursday 6/Feb/2003 I went to the Barbican in central London with my mother to visit the library
and have a meal. Security Service naturally knew about it because it had been mentioned the previous day in our house which is under constant
surveillance on grounds of "National Security", so they may have been able to inform staff there to say something to me, as has been done elsewhere.
Two of the people at the Enquiries desk in the library obviously knew of my circumstances, I spoke to one of them who was very polite, and while
I was waiting I heard the other speaking with a little less politeness, as recorded on this audio file. He said, "I spy", to start a game of
guess what "I spy"; unsubtle, MI5 Spy. Then, at the 34 second mark on this clip he said;

"So obvious you couldn't even get that. I shall have to kill you. ha, ha, ha"

The words "I shall have to kill you" are interesting because such overt expression is rarely heard. Security Service wish me extinct.
Some years ago they were openly shouting "suicide" at me, so that is established. But there is an element of doublethink in their attitude;
they use people's natural prejudice against mentally ill, who are popularly painted by media as being aggressive, to try to tinge the group's
view of me and MI5's actions against me. The Security Service religion is that the country's enemies are deadly, and must therefore be
extinguished. Hence, we must seize eagerly upon the disabled schizophrenic from Clapham, and throttle him, because who knows what'll happen if we don't.

There may be a subtle agenda of population control in what the Security Service have been doing in this country since 1990. In the current issue
of 2600 Magazine (the Hacker quarterly, which I read from time to time) there is a quote from Hermann Goering on page 2; "the people can always
be brought to the bidding of the leaders. All you have to do is tell them they are being attacked. It works the same in any country".
2600 printed the quote as a comment on the projected war against Iraq, which does not appear to pose any threat to the territory of
those countries which wish to invade it. However the quote is somewhat relevant to my case, which is widely known about within Britain;
the security service instructs all right thinking citizens to do MI5's bidding and band together against a common enemy, while at the same time
there is a suggestion of "look what'll happen to you if you don't obey us".

Fanatic's Fare for the Common Man

Certainty level: 90%

The article reproduced below was penned by Bernard Levin for the Features section of the Times on 21 September 1991. To my mind, it described the situation at the time and in particular a recent meeting with a friend, during which I for the first time admitted to someone other than my GP that I had been subjected to a conspiracy of harassment over the previous year and a half.

There is a madman running loose about London, called David Campbell; I have no reason to believe that he is violent, but he should certainly be approached with caution. You may know him by the curious glitter in his eyes and a persistent trembling of his hands; if that does not suffice, you will find him attempting to thrust no fewer than 48 books into your arms, all hardbacks, with a promise that, if you should return to the same meeting-place next year, he will heave another 80 at you.

If, by now, the police have arrived and are keeping a close watch on him, you may feel sufficiently emboldened to examine the books. The jackets are a model of uncluttered typography, elegantly and simply laid out; there is an unobtrusive colophon of a rising sun, probably not picked at random. Gaining confidence - the lunatic is smiling by now, and the policemen, who know about such things, have significantly removed their helmets - you could do worse than take the jacket off the first book in the pile. The only word possible to describe the binding is sumptuous; real cloth in a glorious shade of dark green, with the title and author in black and gold on the spine.

Look at it more closely; your eyes do not deceive you - it truly does have real top-bands and tail-bands, in yellow, and, for good measure, a silk marker ribbon in a lighter green. The paper is cream-wove and acid-free, and the book is sewn, not glued.

Throughout the encounter, I should have mentioned, our loony has been chattering away, although what he is trying to say is almost impossible to understand; after a time, however, he becomes sufficiently coherent to make clear that he is trying to sell the books to you. Well, now, such quality in bookmaking today can only be for collectors' limited editions at a fearsome price - �30, �40, �50?

No, no, he says, the glitter more powerful than ever and the trembling of his hands rapidly spreading throughout his entire body; no, no - the books are priced variously at �7, �8 or �9, with the top price �12.

At this, the policemen understandably put their helmets back on; one of them draws his truncheon and the other can be heard summoning reinforcements on his walkie-talkie. The madman bursts into tears, and swears it is all true.

And it is.

David Campbell has acquired the entire rights to the whole of the Everyman's Library, which died a lingering and shameful death a decade or so ago, and he proposes to start it all over again - 48 volumes this September and 80 more next year, in editions I have described, at the prices specified. He proposes to launch his amazing venture simultaneously in Britain and the United States, with the massive firepower of Random Century at his back in this country, and the dashing cavalry of Knopf across the water, and no one who loves literature and courage will forbear to cheer.

At the time this article was written I had believed for some time that columnists in the Times and other journalists had been making references to my situation. Nothing unusual about this you may think, plenty of people have the same sort of ideas and obviously the papers aren't writing about them, so why should my beliefs not be as false as those of others?

What makes this article so extraordinary is that three or four days immediately preceding its publication, I had a meeting with a friend, during the course of which we discussed the media persecution, and in particular that by Times columnists. It seemed to me, reading the article by Levin in Saturday�s paper, that he was describing in some detail his "artist�s impression" of that meeting. Most telling are the final sentences, when he writes, "The madman bursts into tears, and swears it is all true. And it is." Although I did not "burst into tears" (he seems to be using a bit of poetic licence and exaggerating) I did try hard to convince my friend that it was all true; and I am able to concur with Mr Levin, because, of course, it is.

At the beginning of the piece Levin reveals a fear of being attacked by the "irrational" subject of his story, saying "I have no reason to believe that he is violent, but he should certainly be approached with caution". This goes back to the xenophobic propaganda of "defence" against a "threat" which was seen at the very beginning of the harassment. The impression of a "madman running loose" who needs to be controlled through an agency which assigns to itself the mantle of the "police" is also one which had been expressed elsewhere.

In the final paragraph of this extract, his reference to Everyman�s Library as having "died a lingering and shameful death a decade or so ago" shows clearly what sort of conclusion they wish to their campaign. They want a permanent solution, and as they are prevented from achieving that solution directly, they waste significant resources on methods which have been repeatedly shown to be ineffective for such a purpose.

Private Eye, 23 Oct 1992

Certainty level: 25%

I'm not really sure whether this cover was intended to get at me, or whether it was re-interpreted after publication to be about me. This issue of Private Eye came out in October 1992, by which time I had been under severe continuous pressure at work and from the general population in Oxford for many months. It had John Major saying to his wife, "Come back, Norma!" under the title "Major's support lowest ever".

There's a story behind this. In late October I was in the local pub (the Rose and Crown, nice traditional name eh) with two people from work, Simon and Phil. Phil had with him a copy of the current Private Eye. These are both "nice people" and on my side, I hasten to add. Simon pointed out the message on the magazine's cover to Phil, and asked "what do you think about that". Phil answered, "Well usually they [Private Eye] get it right". This exchange happened in front of me. Although I was ill at the time (this was before I'd started taking medicines) I hadn't read anything into the Eye cover until these guys pointed it out to me.

Sometime later, again in the same road, a student shouted to one of his friends, "so when are you COMING BACK?", again in front of me.

What I realised Phil thought it meant was a double-entendre, the "coming" referring to the act of ejaculation, the "back" referring to the human back-side. So in a play on words you get a person who is referred to as a back-side ejaculating. Charming.

Of course, Phil could have been wrong. Perhaps there was no such meaning intended by Private Eye. Perhaps he saw meaning which wasn't there. Perhaps the moon is made from green cheese. Who knows?

Victor Lewis-Smith

Certainty level: 10%

Victor Lewis-Smith has issued a denial through his webmaster John Hayward-Warburton regarding this article; he says quite categorically it's not written about me. I kind-of sort-of believe him, but I think the conspiracy is so wide that the phrase "Eventually, I had to leave because they were all trying to kill me" could have been intended to be as if from any paranoid person, but could have been influenced by my case in the particular. So the influence could have been sort-of subconscious.

This article is from the Evening Standard of Thursday May 8, 1997. It is titled "Goon, and best forgotten" and may be found on page 31.

I think VLS has written/produced stuff specifically about me in the past, both in his Evening Standard column, one of which is reproduced below (in another case, he was talking about computer hacking, and I think that was directed at me), and a television programme in around late 1993 when he has a taxi driver who says "they're all trying to kill me guv" and VLS responds "you're supposed to be quite intelligent aren't you".

However, his webmaster has issued a formal denial on his behalf, so it
is not for me to oppose what he has stated categorically.

rec.radio.amateur.homebrew:14702 alt.fan.nikki-dial:145 hr.org.fer:137826

Introduction to the Sent Faxes webpages

Between 1998 and April/2000 I sent some thirty articles on the subject of the MI5
Persecution to
British politicians, media, legal and diplomatic entities in the UK. Of those
articles 24 are reproduced
on this part of the website. They were originally composed as Microsoft Word
documents, and saved to HTML
form for publication here. A few of them were slightly edited in format for
readability.

You will see that these articles cover quite comprehensively what has been going on since 1990, there being quite a lot of material to cover, since it is a rare week that goes by without MI5 making some harassing or threatening action against me. "How could it be True?"... they use the mental illness which they induced in me as a ready explanation for my complaints. Who started it, why did it start, why it continues... these faxed articles provide examination in more depth of the treatment in the Frequently Asked Questions webpages. The sheer meaninglessness of the Secret Police actions is highlighted; their operatives make their livelihoods by cynically exploiting the taxpayers, when in a more responsible country they would be looking at the inside of prison cells.

The validity of this observation is proven by their reaction to my several suggestions in the articles that I would cease sending faxes if MI5's agents (and it's always the same people doing the persecution) desisted from continually harassing me. A number of times, you will see in the faxed articles, I have suggested that we come to a "peace of mind agreement" where I cease complaining and they cease harassing. On one occasion, I wrote to Hugh S.-W., the director of OCTS where I was employed in 1992-94 and who is aware of the circumstances, asking that he intercede to bring this matter to a close, by initiating a meeting between myself and the persecutors to mutually settle our differences; he didn't reply, but MI5 did soon after - they said "This is what you wanted, wasn't it?, some sort of confrontation?". The reality is the people stalking me are not interested in any settlement; for them crime pays, and pays handsomely; moreover it is State-approved crime; the Police will never investigate or take action; it is corruption on an incredible level and scale, and it has gone on for over a decade.

You will see that the articles contain three elements; firstly, there are original written articles, many in the first half of 1999 when I was writing new articles every week and sending them by email and fax during the weekend; then there are "MI5 Persecution Update" articles, which list happenings recent to a particular transmission; and finally there is the "old faithful" Frequently Asked Questions article which was sent on a few occasions during the three year period. These articles generated a number of interesting responses from politicians and other recipients, many of which are documented in the "received faxes" area of these webpages.

I hope you enjoy reading these articles. I'm not as angry as these articles necessarily make out, only sometimes, usually soon after the persecutors have said something unpleasant at me; the purpose of putting lots of fire and ire into the mix is to try to chuck it into the public domain which might lead to MI5 being forced to curb their actions. Unfortunately that aim was not achieved, despite many, many thousands of faxes being sent. Also, if any policemen are reading this, then I'm (a bit) sorry about the rude things I said about "the Bill" in one or two of the articles; the police have never done me any harm (yet) by commission, only by omission of doing anything to investigate my complaints or treat them seriously.

Faxes Sent to British Diplomatic/Legal logs

During the 1998-2000 period my records indicate that I sent at least 3,642 faxes to diplomatic and legal offices located in the British isles, of which 3,345 went via TPC's email-to-fax service and 297 were sent via fax-modem direct from my computer. The actual figure is somewhat higher since, for most of this period, whenever a recipient asked to be deleted from my mailing list, I totally wiped all entries including that from the logfile.

In the records "Y" indicates successful transmission from fax-modem, "N" indicates failed transmission from fax-modem.
"E" indicates an error occurred while transmitting via fax-modem and a fax may have been only partly transmitted.
"y" and "n" indicate success or failure via TPC.

In April 2000 I changed the method of operation by recording "R" when a recipient requested removal, rather than wiping their details from my mailing list and records; and keeping "B" records for when TPC actioned a ban on a recipient's fax-number, but the recipient did not write to ask me to cease faxing. The purpose of these changes was to keep more accurate and complete records, but the intention was thwarted by the police complaint.

Faxes Sent to British Media logs

During the 1998-2000 period my records indicate that I sent at least 6,137 faxes to the British media,
of which 5,775 went via TPC's email-to-fax service and 362 were sent via fax-modem direct from my computer.
The actual figure is obviously higher since, for most of this period, whenever a recipient asked to be deleted
from my mailing list, I totally wiped all entries including that from the logfile.

In the records "Y" indicates successful transmission from fax-modem, "N" indicates failed transmission from fax-modem.
"E" indicates an error occurred while transmitting via fax-modem and a fax may have been only partly transmitted.
"y" and "n" indicate success or failure via TPC.

In April 2000 I changed the method of operation by recording "R" when a recipient requested removal, rather than
wiping their details from my mailing list and records; and keeping "B" records for when TPC actioned a ban on a
recipient's fax-number, but the recipient did not write to ask me to cease faxing. The purpose of these changes
was to keep more accurate and complete records, but the intention was thwarted by the police complaint.
Also in April 2000, I added some further fax numbers to my media mailing list and records, which is why some of the
faxnumbers below have only a single entry, and some indeed have none.

It is, but given that they gave you the design software for free, it's a pretty reasonable business proposition if you're aware of everything when you start doing business with them -- no one forces you to use that free software, after all.

Faxes Sent to British Parliament logs

During the 1998-2000 period my records indicate that I sent at least 14,480 faxes to the British Parliament
in Westminster, of which 9,138 went via TPC's email-to-fax service and 5,342 were sent via fax-modem direct from
my computer. The actual figure is obviously much higher since, for most of this period, whenever a recipient asked to
be deleted from my mailing list, I totally wiped all entries including that from the logfile.

In the records "Y" indicates successful transmission from fax-modem, "N" indicates failed transmission from fax-modem.
"E" indicates an error occurred while transmitting via fax-modem and a fax may have been only partly transmitted.
"y" and "n" indicate success or failure via TPC.

In April 2000 I changed the method of operation by recording "R" when a recipient requested removal, rather than
wiping their details from my mailing list and records; and keeping "B" records for when TPC actioned a ban on a
recipient's fax-number, but the recipient did not write to ask me to cease faxing. The purpose of these changes
was to keep more accurate and complete records, but the intention was thwarted by the police complaint.

It has been down since I changed from AT&T. I still need to set up another one.

A flashover on my homebrew amp took out the screen bypass cap. Dont think it hd yor symptoms but something to check.

Jimmie

While surfing the net I came across a lot of Hams building and
restoring old transmitters. I'm starting this group to further that
endeavour.

With a LTspice simulation of a MC1496, I've confirmed that the impedance between the CW source and the product detector input does have an effect on the distortion of the audio beat note output as well as distorting the envelope of the input signal. Now I cannot vouch for the accuracy of the model - it's one that I found in a message on a forum but the envelope modulation of the CW carrier can look very similar to what I see in the FT-817 with the appropriate choice of amplitudes and series resistance. I stepped the source amplitude through the distortion minimum of the audio output for three levels of source resistance: 1K, 51 and 1 Ohm and obtained THD of 7.7%, 5.3% and 5% respectively. All these were done with the BFO source resistance at 51 Ohm; at 1 Ohm for both the signal and BFO, the output THD dropped to about 3.5%; distortion of the BFO envelope by dynamic loading is visible at 51 Ohms.

Now these levels of THD are not especially impressive which is why I'm questioning the model. The circuit is that for a product detector straight off the ON-semi datasheet. I think the NJM2594 bears some resemblance to the MC1496 - both switching differential amplifiers rather than diodes but maybe offers a higher input impedance.

Aaagh - I have to revise this. While writing this, I discovered that the product detector schematic in the Application Note AN531/D has a couple of extra components that make a huge difference in distortion and output level - now getting as low as 0.1% for that last example! That's where it should be. I'll re-run these sims and revise the results (and maybe the conclusion!).

Major retraction! The appnote has one extra component and I missed one
on the datasheet when capturing to LTspice. With those in place, I see
no modulation of the input CW envelope by the product beat note and
the output distortion is consistently much lower than what I saw with
the erroneous schematic. Now that leaves me wondering if the circuit
around the NJM2594 in the FT-817ND is optimum or am I seeing a
simulation that represents an ideal that is unattainable in practice.

And I seem to recall warnings about measuring right at the tube pins,
so the wiring from the transformer and the even the pins of the socket
are taken into account.

not work, therefore they shall not eat, said the Communists, but they shall do one service in providing food. It is now an offence to have a dog or a cat or a pet of any kind." I looked in horror at the monk. An offence to keep a pet! Instinctively I looked again at the Chakpori. "What happened to our cats there?" I asked.

"Killed and eaten," was the reply.

I sighed and thought, "Oh! If I could tell people the truth about Communism, how they really treat people. If only the Westerners were not so squeamish!"

I thought of the community of nuns of whom I had

heard so recently from a high lama who, upon his journey, had come across a lone survivor and heard her story before she died in his arms. Her community of nuns, she told him, had been invaded by a wild band of Chinese soldiers. They had desecrated the Sacred Objects and stolen all that there was of value. The aged Superior, they had stripped and rubbed her with butter. Then they had set her alight and laughed and shouted with joy at her screams. At last her poor blackened body lay still upon the ground, and a soldier drew his bayonet the length of her body to make sure that she was dead.

Old nuns were stripped and had red hot irons thrust into them so that they died in agony. Younger nuns were raped in front of each other, each being raped some twenty or thirty times during the three days that the soldiers stayed. Then they tired of the "sport", or were exhausted,

flat on his back. To my surprise, as I looked around, I saw that quite a crowd of workmen had arrived. "He's thrown the Boss," said one; "He must have been taken by surprise," muttered another. Violently the swarthy man erupted from the ground, like a rubber ball bouncing. Dashing into the workshop he picked up a steel bar with a claw on the end, a bar used for opening packing cases. Rushing out, yelling oaths, he swung at me, trying to rip my throat. I fell to my knees and grabbed his knees and pushed. He screamed horribly, and fell to the ground with his left leg broken. The steel bar left his nerveless hand, skidded along the ground, and clanged against metal somewhere.

"Well, Boss," I said, as I rose to my feet. "You are not Boss of me, eh? Now apologize nicely, or I will beat you up some more. You tried to murder me."

"Get a doctor, get a doctor," he groaned, "I'm dying."

"Apologize first," I said fiercely, "or you will want an undertaker."

"What's going on here? Eh? What is it?" Two French policemen pushed into the throng, looked at "the Boss" on the ground, and laughed uproariously. "H

Tom et. al.,

You're right...I misread the datasheet, it shows Id skyrocketing if Vg1s>0. But of course the protection diodes should do the trick. The datasheet also specifies Vg1s and Vg2s breakdown at >6V. So although for practical purposes the gates are not interchangeable, it shouldn't have killed the part.

Below 30mhz the tubes will probably survive just fine with 6.3v.  Above
this frequency the tubes cathodes start to self heat a bit due to
back-bombardment by electrons as the tube reaches self-resonant
frequency.  In fact, when operated near 500mhz the heater voltage should
be backed off to about 5.5 volts because at full power the cathode would
overheat at 6.0 volts.

Been wondering about that We recently modified (slightly*) an ex-
computer SPS power supply to provided some hefty +12 volts for VO1GXGs
semi mobile rig. It's worked fine so far.
Understanding that those SPS have a first stage that produces
somewhere around 350 volts DC (Hoping it is +ve to chassis or common
negative ???) could it be used for B+/HT?
Also wondering if the 5 volt outputs could be modified to provide 6.3
volts for tube heaters. However what about 'noise/RFI' from the up to
200 kilohertz switching frequency?
Any links to sources of info.
Mainly cutting off extra wires/connectors and installing a 2 ohm load
on one of IIRC the 5 volt outputs to cause the unit to operate!

No - that "first stage" is rectifying directly from the mains, so the rectified output cannot be connected to a grounded chassis. Only the low-voltage outputs have the necessary transformer isolation.

(Yes, it is technologically possible to work around this... but all you're doing is reinventing a cheap live-chassis radio from the 1950s.)

>Also wondering if the 5 volt outputs could be modified to provide 6.3
>volts for tube heaters.

There is usually enough 'headroom' in the voltage regulation loop to increase the output voltage by 1.3V. The modification is mainly about identifying the potential divider that feeds a sample of the output voltage back into the control loop, and moving the feedback tap closer to 0V. Some supplies have a trimpot at this location, but most will require a resistor change.

The other problem is that the heaters will have a low resistance at switch-on. A voltage-regulated supply will attempt to develop the full normal voltage across this low resistance, creating an amplified current surge. To prevent this, either the supply must have suitable current limiting built-in, or you need to modify it for a ramped start-up.

WC6W has also published an add-on current limiter on the web; search for the callsign.

>However what about 'noise/RFI' from the up to
>200 kilohertz switching frequency?

The original question was about heaters for a 500W-class power amplifier. Because signal levels are very large, conventional shielding and input/output filtering will normally be sufficient to keep the output free from switching-frequency harmonics, or sidebands on the output frequency. Doing the same thing for a receiver is very much more difficult.

Hi,

I have a faulty Boonton 51013 power sensor, which is a diode based probe for the 4220 RF milliwattmeters. And one of the two detection diodes is out. Of course both diodes would probably need to be replaced and full calibration to be done again; but do you have any idea for a potential replacement diode, not too difficult to find and working up to 10 or 20GHz ?

Thanks for your ideas. Experiences of 510XX sensors repairs would be also welcome, as the diodes are packed in a copper film...

Robert

Don't know specifically about your Boonton, but would a diode from the
Avago HSCH-53xx series be useful? Some are rated for use up to
26GHz. They are small, of course, about .006 inches wide and .027
inches long (with leads that could perhaps be cut to yield perhaps .020 inch net length, if absolutely necessary).

Cheers,
Tom

Pete, KE9OA, had a section on his website with info on those RF Millivolter
probes. Also, the diodes are still available from Boonton, but they are a
tad
pricey.

Pete

I wonder if it is similar to the RF Voltmeter probes. They also use a dual
diode design.

Pete

I found an 8VAC 10 amp transformer I think I am going to use this because I
can use it with practical sized ballast resistors to limit turn on surge.
Can anyone think of a reason not to do this?

Jimmie

The larger the dropper resistor, the more the heater voltage will vary with mains voltage. It isn't a large effect, but the manufacturer's tolerance on heater voltage is only +/-5% (in this case, 5.7-6.3V).

The final answer will depend on the stability of your mains voltage, measured right at the amplifier. Part of this will depend on the utility company, and part will depend on your local wiring because the B+ supply will tend to pull the voltage down.

Im trying to build a 50 watt modulator by connecting some amp transformers back to back. some of the transformers have 4 ohm outputs others 8 , 16 and even 2 ohm outputs. Can someone tel me how to calculate the turns ratio through something like this. I have a collection of transformers with various input and output impedances.

Jimmie

Hi,

Can you post some more information...

What is the source of the audio and it's output impedence ?

What would you like to modulate ? What is the related supply voltage ?

Regards,

Mark

=================================
Although I haven't built the circuit myself , I feel an excellent (but
relatively elaborate)circuit can be found in QEX July/August 1999 page
50 -55.   A regulated 2400V Power Supply ,by VE6AXW

It involves 2 pcs SRC in the transformer primary winding being
controlled by an opamp type voltage regulator sensing a small fraction
of the regulated HV.   The circuit features a soft start

The circuit could be adapted for filament voltages with only the sensed
voltage rectified for the opamp ,but with the filament(s) on AC.

Advantages :
1) Accurate filament voltage regulation and adjustable for optimal
kathode emission without exceeding rated voltage.

2) Soft start

Frank GM0CSZ / KN6WH

Turns ratio is easy, at least to a good approximation. Just connect one winding to an AC voltage within the frequency range of the transformer, and measure the voltage on that winding and the voltage on the winding you want the turns ratio to. The ratio of the voltages is the turns ratio. That does assume the coupling between the windings is good. It's possible with more measurements to figure both the coupling and the turns ratio, but for any self-respecting audio transformer, it's safe to assume the coupling is quite good.

Beware: many output transformers for tube/valve circuits are designed to have only balanced DC in the primary--that is, they are not designed to have the DC to an RF power amplifier flowing through them. That DC can saturate the core (or bring it close enough to saturation that you'll have problems when you add in the audio).

Determining the design impedances of winding on an audio transformer is tougher than determining the turns ratio, since the rated impedance is somewhat subjective. Impedance, power level, DC imbalance and frequency range are all somewhat inter-related.

Cheers,
Tom

Foxy's Showtime on Capital FM 25/11/98 7.35pm

Certainty level: 100%

This one, I can say with absolute certainty, is about me. It was recorded on my Sony Recording Walkman on the evening of Wednesday 25 November 1998. It doesn't mention me by name, so the objective observer might have trouble understanding why I'm so sure it's about me. I'm sure, because the harassment had restarted over the period when this piece was broadcast, and what Capital transmitted would have been in context with events at the time. (Sorry if that explanation is somewhat opaque, but I don't really want to embarrass myself by giving an explanation in detail, and an intelligent reader should be able to work it out for him/her self.)

This isn't the first time Capital have "got at" me; they were doing so right at the very beginning in summer 1990, when they said, "if he listens to Capital then he can't be all bad"; and Tarrant made remarks about me in his breakfast show in spring 1994, when he said, "you know this bloke? he says we're trying to kill him. We should be done for attempted manslaughter."

Unfortunately I didn't record those previous, much more conclusive instances of harassment by Capital DJs, and Capital Radio tells me they only keep recordings for three months. But lately I've been recording everything, and here is one product of that recording.

Neil Fox was introducing some petite Swedish songstress, sounded like Amelia, when he said something about her petite-ness ;

"she's a big big girl, actually she's really about tiny, she's this big, would you say what less than....."

then one of his studio staff shouted, "six inches"

then Fox laughed and said, "less than a meter tall, definitely"

What I think the "six inches" referred to should be obvious. I think it's sexual abuse directed at me.

Also there were a lot of words like "crazy", "mad" etc on this programme, which reinforced my belief that this was on purpose directed at myself.

I think Fox may be something of an unwilling participant in this abuse, he doesn't want to be an abuser but the persecutors are using his show and his staff to get at me. This is not the first time this sort of thing has happened from his show; and my guess is that it won't be the last

Jackie King from the Flying Eye 14/3/99

Certainty level: 40%

In early March 1999, Capital Radio alleged they had received some emails, one of which was forwarded to me. It contained the words, "you know this bloke, he says we're trying to kill him, we should be done for attempted manslaughter!" which Chris Tarrant had said in 1994.

Following these emails there was an explosion in abuse activity, both from Capital Radio, and from MI5 themselves. MI5 followed me around and hurled abuse at me. The following audio file contains what may be abuse from the radio station.

Jackie King from the Flying Eye made these remarks on Sunday (14/3/99) lunchtime 12.24pm; "gas main work being, er, HANDLED if you like (laughs, embarrassed) outside Madame Tussauds, Euston Road obviously feeling the backlash of that".

The key word is "handled", which she sounds embarrassed to be saying; to me it looks like an attempt at a sexual slander. Capital Radio aren't even pretending not to get at me any more. I asked Chris Tarrant several times about his remark from 1994, and he has consistently avoided answering.

Virgin Radio-Johnny Boy (21/August/1998)

Certainty level: 60%

On Saturday 15 August 1998 I attended a gathering of contributors to newsgroup uk.misc at London's Victoria railway station. Also present was Simon G, who had previously given this description of what he would be wearing;

At 06:36 AM 13/8/98 GMT, Simon wrote:
>further clarification to aid recognition, i'll be wearing
>a t shirt, a brown suede waistcoat, a brown suede miniskirt,
>& a pair of patchwork leggings (& may have a widebrimmed straw
>hat, too).

It is my belief that my persecutors, who monitor my home telephone line (and consequently read all modem communications including email), were aware of this meeting, and may even have observed the "meat" taking place.

Following the "meat" it seemed to me that one or two attempts were made by my persecutors to portray me as "gay", on the basis of Simon's suede miniskirt, which in their inventiveness my persecutors attributed to me, not Simon. (Just for the record, Simon is hetero, and has agreed to the above email extract being published.) The following item from Johnny Boy's Wheels of Steel (between 7pm-11pm, Friday 21/8/98) is one such attempt.

(conversation) (J=Johnny-Boy, H=Hipster)

J: Texas of course part of V98 this weekend enjoy it if you're going. Keep your eyes out on Sunday in Chelmsford for Hipster, because he's going to be there. What are you going to be wearing?

H: I'll be wearing my, er, my suede shorts.
(sycophantic laughter)

J: and believe me he ain't joking, he ain't joking. OK coming next at Virgin on the Wheels of Steel...

Why do I think Hipster's "suede shorts" refers to Simon's mini-skirt? Because "suede" in both cases (obvious!); because "suede shorts" indicates "gay" which they were trying to pin on me; because "shorts" = something short, such as a "mini"-skirt; and because the two DJs both laughed as soon as Hipster said "suede shorts", they knew what the joke was, they knew that they were meant (and probably paid) to find it funny.

Virgin Radio-Johnny Boy (19/June/1999)

Certainty level: 30%

I'm not quite sure about this one, so I've given it a one in three chance of being about me. First the background.... from mid-March 1999 for some three or four months, every weekend, I bombarded Westminster MPs with faxes about the terrible, all-encompassing MI5 Persecution. (Jesting aside, it really is terrible and all-encompassing, in the UK anyway.) Of course each week some MPs replied; but in June 1999, after I'd been at it some three months, I started getting "covert" feedback from Virgin Radio.

The first feedback I got was from Danny Baker, on Sunday 13th June. That weekend I was sending an article which contained biting criticism of the police inaction in this case. Danny Baker on his Virgin radio show started an angry rant that "he knows it's rubbish", ie. he was rubbishing what I'd said in that weekend's faxed article. Unfortunately I wasn't recording this programme.

The next possible Virgin-Radio feedback was a week later on 19th June 1999. This is contained in the audio file above, in which Johnny Boy on his "Wheels of Steel" programme says;

"and if you would like to put a triple play together, ahhh.... because quite frankly Hipster and me are running out of ideas...."

He goes on to counter Hipster's "how dare you" with a protestation that he is "only joking".

What I reckon is that my article faxed to MPs that weekend was forwarded by one of the recipients to Virgin Radio. My article had included the words;

"I am beginning to run out of both new topics and energy to write these articles."

So what I reckon is that Johnny Boy read the article.... and rephrased the above line "run out of ... new topics" to "running out of ideas". I recognise that this is a pretty tenuous inference to make.... but do listen to the audio file, from the "ahhh...." pause in JB's speech you can guess he is about to say something "risky" and at someone's expense. Anyway, I listen to the Wheels of Steel regularly and will continue to do so, recording it as I always do - so any future funny remarks will get immortalised on these pages!

Brighton Day Trip - 24/Sept/1998

Certainty level: 5%

On a day trip to Brighton, carrying a minidisc recorder, I managed to collect several indistinct instances of what I think were people swearing at me. Between the 0.5 and 1.5 second marks of the above recording is something that sounds like "nutter". I recorded at least three other much more obscene sexual words on the same day.

I don't honestly think the "nutter" recorded here is part of the conspiracy against me. I've been called similar things elsewhere, where it's been blindingly clear that the insult does form part of the conspiracy - but not in this case. This illustrates quite a worrying point - as a result of the many years of abuse "in public", I now sometimes simply don't know whether somebody is insulting me because they think I look like a dweeb, or whether the conspiracy is in action. Sometimes, due to background noise and people talking quietly relative to ambient noise, I can't be sure of what's being said, even after listening to it again on my minidisc. Or put another way, I now have a mild form of what I recognise to be occasional auditory delusions - but these are fuelled by the many years of actual verbal abuse.

POSK Cafe - 2/Feb/1998

Here are two independent segments, both of which occurred in London on the same day, the first at a Polish cafe, the second on the Tube.

Certainty level: 100%

POSK is the Polish Social-Cultural Centre in Hammersmith, London. It has quite a nice cafe which does pierogi, golabki etc. I went there with my mother early in 1998. Seated at the window table were three Polish men talking amongst themselves. One of them let rip with a sexual obscenity which was clearly directed at me (it's the same one that's been heard again and again since about November 1995), and which was recorded on my minidisc walkman. I have not included it in the above excerpt, which shows the reaction of another of the trio to the first man's swearing - namely, "jestes swinia jednak" which in English is "nevertheless you're a swine".

Certainty level: 20%

Somewhere on the London Underground. "Psycho" (I think - a little unclear).

Leicester Square - 9/Feb/1998

In February 1998 I spent some time in Leicester Square, in the West End of London. This is a very busy area of London, and one which can be relied on to produce "contacts". Capital Radio's offices and their cafe are located here, the Trocadero is nearby, and the place is full of cinemas and entertainment venues.

Certainty level: 100%

A young girl is heard to say, "Alright I'm going to talk to myself" to her friends, followed by all of them laughing together, as I passed by.

Believe me, I do not look mad in real life, these young people would not have directed their comments and laughter at me unless they had already been told by others that I was ill. I am absolutely certain that their behaviour was directed at me, and this audio file is particularly clear.

Certainty level: 60%

This one was recorded in a cafe in Green Park. Two women are talking to each other, one of them says to the other, "something wrong with him", with an emphasis on the "wrong".

The words "something wrong with him" have been repeated at me dozens of times, at my former workplace in Canada, in England, etc. The words are quite deliberately chosen to have two meanings; they obviously imply that I am ill, without forcing the abusers to demean themselves by using more pejorative terms, although they have shown that they have no compunction in that area; and secondly, the words "wrong ... him" make me at fault, and place the guilt for the abusers' wrongdoing on my shoulders.

Certainty level: 30%

Recorded on a Victoria line tube train leaving Green Park station. If you listen carefully you can pick up the word "hunchback". The speaker had emitted a swear word immediately before this excerpt; both the swear word, and the "hunchback", were (I believe) directed at me.

Does anyone know of a simple, but free PCB layout software.

Or a way to convert .pcb files from EXPRESSPCB to industry standard format.

I currently use ExpressPCBs layout s/w which is fine for my applications
and great for prototypes. But I want the option to use other vendors when
the volume gets high, i.e. selling kits.

It might be worthwhile to look at the various ports in the FreeBSD
CAD library. Chipmunk and electric are among them, though neither seems
to emphasise PCB layout. Perhaps there are other, more appropriate offerings.
http://www.freebsd.org/ports/cad.html is a reasonable place to start

Good luck,

BF545 is somewhat similar, though notably lower gfs. MMBF4416 is probably closer. If you go to the ON Semiconductor web site, you'll find you can get to a selection table for JFETs. There are several (mostly MMBF* numbers) SMT parts with characteristics similar to the BF245A/B/C series. I suppose NXP (Philips' spun-off semiconductor supplier) has similar on their website.

Cheers,
Tom

My magazine column has been asking for similar recommendations for free
software.

ExpressPCB is an excellent deal for anyone who is not affected by its
restrictions (which I think are quite fair); but that doesn't help in
John's situation.

Someone recently recommended Kicad, a free open-source software suite
covering schematic entry, board layout, Gerber view and 3D views:

    http://www.lis.inpg.fr/realise_au_lis/kicad

I haven't had time to explore beyond the web page, but would be very
interested in comments and evaluations.

If your volume gets higher you'll have the money to purchase software, right?

Of course, there are some pretty good 100% free options: KiCAD and gEDA being the most well-known.

Advanced Circuits has some "free" software like ExpressPCB but you do have the option of getting the real Gerbers (not just some proprrietary format) back after your first order with them (see: http://www.4pcb.com/index.php?load=content&page_id=46) -- this strikes me as an entirely fair arrangement.

I'm using Eagle. I like it just fine. You can do 80x100mm 2-layer
boards for free, and the step up to bigger 4-layer boards is either $50
or $150 -- in either case it's cheap.

Thanks Tom,

this was the right hint to me concerning the replacement for the BF244-7

FET's.

The Fedora project just released a custom Live CD oriented toward
electronics development. It includes gEDA, as well as kicad, so this is a
pretty painless way to try it out. hmmm ... I can't seem to find the
original link at fedoraproject, but a quick google shows dozens of places it
can be downloaded from ... google on "Fedora Electronic Lab"

..

Try gEDA -- free. Full suite of design software. Contain gschem to do the schematic, then export to pcb [also in the package]. You can print the layout 1:1 on a transparancy and make your own boards if you want.

Dr. G.

===========================
I found gEDA at one of the Mandriva Linux repositories ....excellent.
Tnx for the info.

The prog is highly likely also available at an Ubuntu Linux repository.

Hello,

I am trying to design and develop a long range portable transmitter.

When I say long range I am talking open distances between 5 km and 10
km radius where a receiver is established at the highest center point
within this radius and also elevated using a 20 meter antenna.

Ideally the transmitter will 'send' a three digit numeric code, such
as 101 or 102.

I have researched existing products and have found one of the VHF variety which would satisfy my requirements however it is exspensive and not exactly of the 'portable' variety.

What I am looking for is suggestions on existing products or designs that could be used to acheive my requirements.

Thank you.

Is this for licensed or unlicensed operation? This is an amateur radio group, but will it be extended to non hams?

Is this a "one off" unit, or do you plan to make
5? 10? 1,000? sell them to everyone on the planet?

What do you mean by the word portable?
Pocket sized?
The size of a book?

A small suitcase?

Will it provide it's own power?

How long will it need to run?

> Ideally the transmitter will 'send' a three digit numeric code, such
> as 101 or 102.

How? CW (switched carrier?) MCW (modulated switched carrier?)
Voice (AM? FM? SSB?), some sort of digital modulation?

Let's take a very specific example here:

You want to operate licensed using the 2m Ham band.

You buy a stadard 2m FM "HT" (handheld radio) and add the following equipment to it:

1. A larger external battery pack.
2. A tone generator for the modulated CW.
3. A device to turn on and off the tones and the transmitter.

Most modern radios can be placed in a standby mode which uses so little power in relation to the transmitter that it is not needed to turn them off. Doing so adds complexity to both the computer program that controls it and the device itself.

A Palm pilot or similar device (think off the shelf technology), to control it.

The program would be something like:

1. Turn on the radio.
2. Wait 10 seconds for the radio to turn on completely.
3. Turn on the tone generator. (may be generated by the controler itself)
4. Switch the radio into transmit mode.
5. Wait 3 seconds for the transmitter to stabilize.
6. Key the transmitter on and off to generate the message.
   Unlicensed operation would use a simpler message, just the transmitter ID, but some ownership contact information might be usefull.

   Licensed operation would be something like
   "DE <callsign>/p <id number>". Different countries have different requirments for unatended operation, including messages.

7. Turn off transmission.
8. Turn off tone generator.
9. Turn off radio.
10. Wait 10 minutes for next transmission.

If you do use CW or MCW, then it should IMHO be no faster than

5 words per minute. The idea is to be identifiable by as many
people as possible.

Range depends upon relative hight to the receiver, antenna type
and power output. It also depends upon what you plan to receive it
with.

Hello Geoff,

Thank you for your response.

> Is this for licensed or unlicensed operation?

Eventually licensed.

> Is this a "one off" unit, or do you plan to make
> 5? 10? 1,000? sell them to everyone on the planet?

I plan to replicate approximately 10 to 15 transmitter units and one receiver. This project is for a volunteer organisation.

> What do you mean by the word portable?

When I said portable, I was referring to it being independant of an external power source or external mounted ariel. It's ideal size would be similar to that of a book, preferably a cellular phone, however cost is the main consideration.

> Will it provide it's own power?

Yes.

> How long will it need to run?

There is no operating time requirement, the only time related requirement is that the power source lasts long enough to transmit a simple message.

> How? CW (switched carrier?) MCW (modulated switched carrier?)
> Voice (AM? FM? SSB?), some sort of digital modulation?

I was thinking AM or FM however CW is an option.

Whichever is the cheapest component wise and irrespective of the power requirements, is portable and can transmit at the desired range of 5 km to 10 km.

Very probably similar, at least if the frequency bands are similar
(100KHz-18GHz for the 51013 probe I want to repair).
Pete, where is your web site ?

Thanks for your advices !
Robert

Ok, then I would start off with what is called in the U.S.
Family Radio Service "walkie talkies". They are cheap,
easy to buy and availble almost anywhere. In the U.S.
they operate on 464 mHz, in most other places 446 mHz.

They have a relatively short range. Stated range is 5 to 10
miles, but unless you are on a mountain top talking to someone
on another mountain top, it's more like 1km or less.

However they can be used without a license and as I said,
cheap. Good to experiment with.

> I plan to replicate approximately 10 to 15 transmitter units and one
> receiver. This project is for a volunteer organisation.

Ok, then I would look into making a controller board or interface
on a printed circuit board. There is plenty of design software
around and you may be able to find a shop that does low quantity
boards for amateur use.

> When I said portable, I was referring to it being independant of an

> external power source or external mounted ariel. It's ideal size would be similar to that of a book, preferably a cellular phone, however cost is the main consideration.

FRS units have permantently attached ariels. Ham radios have removable ones so you can start with a "rubber ducky" type and upgrade to a dipole. A 2m antenna is 38 inches long, around 1 meter.

> There is no operating time requirement, the only time related requirement is that the power source lasts long enough to transmit a simple message.

A battery pack with AA batteries will run one for several hours of sending short messages. You can use disposable batteries or NiMH rechargables for longer battery life. NiMH batteries lose their charge over a week or so, and have problems "floating" on a charger, so if they have to sit in a box waiting for an emergency, alkeline disposable batteries are IMHO better.

> I was thinking AM or FM however CW is an option.

Cheap handheld units are normally FM, this includes FRS type, 70cm and 2m ham radios and 49mHz unlicensed ones.

27mHz CB type radios are AM (and expensive ones SSB), but in the U.S. are restricted to voice only by law. They do have a wider range in most cases.

As for the controllers, the question is exactly how "off the shelf" do they need to be? If you have someone on the project who can figure out how to add the switching logic and a someone to modify the operating system for you, discarded iPods would be perfect. There are lots of them lying in drawers, being too good to throw out and too expensive to fix (mostly battery replacement).

You could also do it with old pocket PC's, Palm Pilots, etc. Probably more easily.

What ever you do, try to get 20-30 of them before you start, several will fail or be broken in development and it's difficult to start over again because you ran out of parts.

>
> Whichever is the cheapest component wise and irrespective of the power requirements, is portable and can transmit at the desired range of 5 km to 10 km.
>

That will have to be found out by testing. 10km in London, New York, or Jerusalem will be very difficult, while 10km in a flat area will be easy.

Geoff.

After I wrote this I was looking through an old magazine and found a cicruit to take the output of a tape recorder and use it to key a transmitter. This one used a single transistor and a relay.

I would update it a bit and instead of using a tape recorder, I would use a small MP3 player. The kind that use a single AAA battery, and look like a package of chewing gum sticks.

If you modify them to run from external power, will run for almost a day on a high capacity AA rechargable battery.

If you create an MP3 file with what you want on it at a low enough bit rate for "telephone" quality, it would run for an hour on 10 megabytes of memory. E.g. a 256 megabyte unit will run for 25 hours.

Some of them will play the same file over and over, so you can loop from when you hit the start button until the battery dies.

The cost is low, WalMart's website has them with 1gigbyte of memory for $25 and I'm sure you can find 64megabyte ones very cheap, or even used for free. Since they all would have the same connection, a headphone jack, getting duplicates would not be a requirement.

Geoff.

Thanks for all the suggestions. However, I should have mentioned that I'm
using Windows 98.

1) gEDA appears to be only for Linux & Mac.

2) I installed PCB artist, but thee's no component libraries, and the
prices for the small runs are about $100 higher than Express PCB

3) I'm not doing this for porfit, Ham radio is my hobby not my job, so
anything boards I make I will either give away, or sell at cost.

4) I'm off to try Eagle that Tim receomnded, 80x100mm 2 payer boards are
fine, all my designs are in PCB Expresses miniboard format.

I have used Protel Autotrax downloaded from
http://www.altium.com/Community/Support/Downloads/
It is DOS program but works perfectly with Windows 98
It can generate gerber files (industry standard) and has no board size
limitation

???  I'm running it on XP (and Linux, too) -- there are standalone compiles
as well as Cygwin.

> 2) I installed PCB artist, but thee's no component libraries, and the

Again, where are you getting this stuff??  The main problem seems to be that
there are so many libraries that it is difficult to locate the part you want
amidst all the noise

Now I'm confused...doesn't Tau (Time Constant) = 1.1RC, hence 1 farad
and 1 ohm would give a time constant of 1.1? Yes, it's only 6AM, but am
I missing something?

I'm playing with super-regenerative oscillators in LTSpice.

My question concerns the 230XP valve VHF super-regenerative oscillator in this figure 8.9:

http://www.holmea.demon.co.uk/temp/duplex.jpg

Here's figure 8.11 from the same book:

http://www.holmea.demon.co.uk/temp/iff.jpg

The text reads: "the super-regenerative oscillator in figure 8.11 is a triode valve connected in a commonly used high-frequency circuit of the Hartley type which relies on the internal capacities of the valve for its operation." Why is it a Hartley when the tap is fed through an RFC?

Does the 230XP oscillator in figure 8.9 also rely on internal valve capacities? How do these oscillators work? What is special about tuning capacitor C in figure 8.11? What is the role of the cathode chokes?

I've been playing with JFET oscillator circuits in LTSpice and I can't get them to oscillate unless the LC network between drain and gate creates a phase inversion. How do these valve circuits make 0 (or 360 degrees) of phase shift around the loop?

What is the nearest semiconductor equivalent of the above valve circuits? Below is a JFET oscillator with feedback from drain to gate; but no reliance on parasitic capacities, although I'm sure they affect the frequency. Is this an LC Pierce?

http://www.holmea.demon.co.uk/temp/osc.asc

TIA
Andrew.

I stand corrected - it was from my own experience of fixing other
peoples radios where a bizarre collection of "mods" had degraded the
actual performance!. But, as you point out, you have the test gear and
the knowledge to eliminate this.

In the end, its going to be something very simple (isnt it always?) and possibly related to an error made while doing something else in there........(been there, done that - still drives me NUTS!!!)

Andrew VK3BFA.

For God's sake hide your astoishment.

Built an active, tunable antenna, and finally have something to seriously play with. As I understand it, sunspot activity is only a notch or two above the all-time recorded low, and I am still able to pick up some stations off the whip, with only a little more noise than with the external antenna. Radio Havana Cuba comes in like it's in my back pocket, which it practically is, and the ubiquitous WWV comes in weakly, which doesn't surprise me too much since I am inside a steel shell and sitting on the floor. Wow. Feels sooo nice. And what's funny is, I can hear the clock on the opposite side of the room ticking quietly in the background of weaker stations. Not sure what to do next. May try adding another stage of amplification to the front end. An NE602, maybe. The project that never dies...

Dave

When the sunspots are really low, there are still radio things that can be done. Disassemble the old solar powered calculator you got as a freebie and use it to power a one transistor oscillator, using one of the many old odd ball crystals you have in a drawer. Then put in a plastic box an hook a piece of wire to it and place it outside. When the sun shines, the radio will transmit. The more you have, the more signals you will hear. You can place many around the neighborhood, if you are into dx.

Since the crystal will be affected by temperature, you can calibrate the actual received frequency with outside temperature and impress your friends.

No, the time constant of a resistance and capacitance is exactly R*C.
The time constant of a resistance and inductance is exactly L/R.

If you want to know the time at which something special happens in an
RC exponential decay, you may have to use the formula:  v(t) =
v(0)*(e^(-t/RC)) (or a variation of that which accounts for the RC
changing from one voltage to a different one).  So, for example, in a
555 one-shot timer circuit where the capacitor starts at (essentially)
zero volts and charges to 2/3 of the power supply voltage, we want to
find t such that e^(-t/RC) = 1/3, and that will be when t=1.0986... *
RC -- or sensibly t = 1.1*RC.  And that likely is where you're
thinking of the 1.1 factor from.  That's not the RC time constant;
it's the time period of a 555 one-shot timer.

Cheers,
Tom

I knew a fellow who had a bank of 1700 amp hour batteries (2 volt cells in series). he dropped a crescent wrench across the terminals and it started spttiong out molten BB sized pellets. He dove for cover and when he finally recovered, he discovered the crescent wrench had disintegrated, and he had pellet sized holes melted into his jacket.

This will be great delight when we can do the same thing with capacitors.

Colin K7FM

Thanks for the CATV transistor suggestion. Getting data for RF transistors
should be easy, but after searching the Internet, the ARRL handbook, QST and
other sources it's proven elusive. Part of the problem is companies that
made transistors, such as Motorola, no longer make these types of devices;
they sold the part of the company that made all the good stuff.

Quickly answering your questions:

The design goal for the RF pre-amp can provide several watts output, although if the RF path is preceded with band-pass filters, the likely hood of actually finding signals with volt magnitude levels is small.

The voltages are peak-to-peak; it's easy to set spice source parameter voltages using peak-to peak values. The isolation is from output to input. Any voltage change appearing at the output, i.e. due to mixer products, should not appear at the input (antenna port). The gain is small, yet large enough to overcome mixer and filter losses.

As previously indicated, the design is push-pull. The base is grounded for each half. The emitters are biased through a center-tapped transformer with -4volts through a 50-ohm current limiting resistor. The collector is similarly powered through a center tapped multi-winding transformer with +12 volts (actually need higher voltage to support the extreme limits). The Internet http://www.qrp.pops.net/preamp.asp has a single ended example for a "A Low Noise, High Dynamic Range Broadband RF Amp".

The design is still in the simulation stage using spice software. Linear Technology LTspice SwitcherCadIII has been particularly useful, but also used other spice simulation software. I started by simulating a design published in QST (Feb, 1993) to explore the differences between spice simulation and a proven design. The spice simulation did affirm the proven design. Any differences found, were traced to details the author left out. In addition, the spice models had to be written or find an existing model; such as the 2N5109B spice model. The transformers were simply modeled as inductors with mutual coupling. LTSpice supports a very useful mutual coupling syntax, where Kxxx L1 L2 [L3 ...] <coefficient value> for values between -1 to +1. For realistic transformers using a value of less then one, can yield low and high frequency roll-off characteristics that match real world RF transformers.

Just a thought - even if not blending in with the scheme of the Homebrewing aspect.

There are a couple pre-amps made to sell which boast a KHz to several hundred MHz of frequency response in amplification ability. Maybe you could check them out. Hosfelt Electronics - I believe - carries them.

Also - I have some older Motorola Data Books here - if you need any info on a particular item. If nothing else, maybe get something to come close to matching.

Maybe not much help but - thought I'd toss it in.

Lou

I'm wondering if they're actually common-grid oscillators relying on
anode-to-cathode parasitic capacitance. This circuit oscillates:

Just a query. Is there any particular reason why you are using the 866's in parallel?

Remember a half wave rectifier puts a lot more strain on your HT transformer. Perhaps though you don't have a centre tap on your secondary winding! Also if you had 4x866's in a bridge circuit you would need an awful lot of heater windings.

Many years ago I built a parallel 811A grounded grid linear amplifier which worked quite well but of course with directly heated tubes you need a really beefy filament choke!!!

Best of luck with the project and remember to always keep a hand in your pocket while playing with 1500 to 2000 volts.

Hey, I think you're right! Sucks to get old! The good news is that
I've never had to be SO precise that using RC or 1.1RC would make any
difference for me ;) Thanks for reminding me :) (The bad news is that
I'm an electronics tech by day and should have remembered that! I guess
I'm waiting for the day when I get in an argument and can say I've
forgotten more than "the other person in the argument" will ever
know!!)...Cheers!!

While I agree that $700 is quite reasonable for an all-band rig, there actually _are_ people for whom $700 is an unreasonable investment in their hobby. It isn't as important for them to actually operate on every band all at once, it's more important that they find a reasonably priced entry point into the hobby.   Listening to the bands, it is sometimes hard to imagine that there are still hams who operate with a budget of less than $3000, and still manage to have fun doing so.

But more important is the simple fact is that I learn more by building than by buying. If ham radio is really more than simply a glorified Citizen's Band, we are supposed to be educating and training outselves both to serve the public and to better our own understanding of radio and the radio arts.   I think any attempt to make experimentation of that sort more accessible to the broad population of hams should be applauded.

Wow. Thanks for the ideas. Seriously though, I am taking advantage of the lull to improve my project's sensitivity and selectivity. There are still plenty of targets to aim at, and I have lots of work to do. I still pick up BBC Africa and a couple of others regularly, and that is enough to keep me quite busy. By the time sunspots pick up again, I hope to have this thing working much harder.

Take it easy... 73 and good DX.

Dave

>
> http://www.holmea.demon.co.uk/temp/osc2.gif

A very perplexing circuit. I'm not sure the original author of this circuit completely understood how it actually worked either! There are at least two plausible mechanisms for the RF feedback, the plate-cathode feedback from inter-element capacitances, or plate-grid feedback from the tank itself through the unmarked capacitor to the grid.

I think the feedback mainly comes from the capacitor to the grid from other side of the tank. (ie a Hartley oscillator) That cap is just a DC blocker I believe. You could probably replace V1 with a JFET and the circuit would work fine without a drain-source feedback capacitor.

The RFC in the cathode circuit is to prevent C1 from shunting the RF on the cathode. This makes the plate-cathode feedback more likely, especially as the plate circuit is floated by its own RFC. I have no idea of the properties of a CV6 tube so I can only guess what is really going on.

The cathode circuit looks very much like it is a self-quenching circuit, but the diagram below suggests it is separately quenched? This is an IFF transponder? The feedback loop is interesting, looks like reflexing to me. I'd guess the entire circuit oscillates at the quench frequency and the modulation is recovered by filtering that output?

I've always wanted to build a toy walkie talkie from a similar circuit. Super-regen on RX and AM on TX by changing the source and drain circuits on T/R.

Hello,

I'm assembling a classic preamplifier with the BF-981 dual-gate mosfet. The datasheet says the best noise figure is obtained with Vg2S= 4V, Vg1S= 0V and Id=10 mA.
So I ended with a Vdd of 9V (because I had a spare 7809) and obtained 4V for Vg2 with a 68k+56k divider, Vg1= 0V through the coil of the tuned input filter, Rs first replaced with a multiturn 500 ohm trimmer to find the correct 10 mA point. Rs and the 56k to ground bypassed with 10 nF ceramic.
Easy, right?
The problem is I can't get the mosfet to drain more than 7 mA (at Rs=0 ohm). I also tried to increase slightly Vg2S by replacing the 68k with another 56k but I end with about 7.5 mA max. Bringing Vd up to 12V makes almost no difference.
Do I have a broken BF-981 (I don't have another one handy to test) or it could be a normal value spread for this device?

Thanks

Francesco IZ8DWF

He did ask for a RECEIVE pre-amp, to 60mHz
Not a power amp, and not 60GHz, and you don't need 4volts for a
receive preamp

How about and MPF102 JFET in Class A
Bias it at about 8mA, and you should get ~20db power gain

I believe the correct time constant for that combination is 1 second, and has been since the '30s at least.

The datasheets generally gives you the average values. The typical values for FETs and MOSFETs are all over the map - so I won't worry that you're not seeing the 10mA drain current. Try out your circuit, you'll probably be happy with it.

Because there are those of us who, for a "receive preamp", would very much like to get IIP3 greater than +50dBm, and ideally up around +60dBm. It may only need to handle 0dBm or +10dBm signals, but it does need to have very low distortion. Not going to happen with an MPF102, at least not without an exceptionally creative circuit around it. I'm not quite sure why the OP wants a preamp in the first place, since noise figure on HF is generally not that much of an issue. It may be in part to get isolation between the mixer and the antenna so he doesn't radiate the LO signal, but that can be done with tuned circuits at least for narrowband radios. I have slightly different reasons for wanting a modest gain very low distortion amplifier like that. In any event, it would be a nice circuit to have in my "bag of tricks."

Cheers,
Tom

It's an IFF responder and it's separately quenched. When lit by radar, it emits a pulse of characteristic duration and much stronger than a passive reflection.

The book also contains examples of the same oscillator circuit but without the cathode choke i.e. grounded cathode.

Aha, that came form the unique (and now quite rare) book "Super-Regen receivers" by JR Whitehead.

Without knowing what the RFC value is, it's hard to say what type of oscillator it is.

There were thousands of super-regens built in the 1960's and 70's using transistors, often OC170 and OC171, for radio control, door openers, alarms, early CB sets and the like. I have a lot of schematics somewhere.

There has been some more recent work done on super-regen receivers,
One was in QEX Sept-Oct 2000.

Barry

You are correct, the pre-amp is needed to get isolation between the mixer and antenna. I want a very high dynamic range and broadband design, as wide as possible to cover the LF to 60Mhz range. I have simulated several mixers, including H-mode mixers; they all disturb the antenna input unless a good preamp is used. The low noise figure is needed mainly for the VHF range and yet the performance comes free in the LF to HF range.

Although I haven't completed reviewing all suggestions, I do appreciate the comments from all.

Thank You.

A couple of things come to mind...
The best noise figure also has another parameter: Vds=10V. It might take that much to push 10mA through the channel.
One other thing to remember is that as Rs increases, Vg1s and Vg2s decrease, which tends to further pinch the channel and reduce Id.
I'd try Vd=12V and Rs=200ohms, and use either a 10k resistor or (better) an RF Choke between g1 and s...that will force Vg1s=0 no matter what the bias condition. That will set Vs=2V, so then an equal-resistor divider from Vd gives 6V which is Vg2s=4V.
If you really can't pull 10mA then it might be worth trying out anyway (as previously suggested), but I'd suspect the device is no good.

Hi Francesco,

The data sheet I was able to quickly find suggests optimum noise
figure at a particular Vds, Vg2s, and Id, but does not mention the
Vg1s required to achieve that Id. I suppose that for your particular
part, you may need to run gate 1 slightly positive with respect to the
source to get the 10mA. However, I doubt that there will be a
significant advantage to doing so with respect to the noise figure.
It will almost certainly be more important to adjust the input
matching to achieve lowest noise figure.

The data sheet I found was old and only seems to have summary data. I
looked on the NXP web site, and found what seems to be a similar part,
the BF991. The data sheet for it is complete, but it seems still very
sparse. I am used to data sheets for low noise RF amplifier
transistors that include graphs of things like noise figure versus
input matching at some particular bias, and possibly for two or three
bias conditions. It was a disappointment to not see something like
that for the BF9x1 parts, though they may be good parts anyway.

Cheers,
Tom

Hello all and thanks for all the answers,

as I already said, I tried to raise Vd up to 12V and Id almost doesn't change, as Vg2s remains constant.
g1 is always at 0V in this design since there's an inductor to ground (part of a parallel resonant LC), so actually Vg1s is slightly negative, less than -0.1V with a 15 ohm Rs. I doubt this really affects the Id. I actually tried to keep Vg2s at 0V and change Vg1s and what I found is a weaker effect on Id with respect to Vg2s, with Vg2s=0V and Vg1s=4V the Id was less than 3mA. Clearly the two gates aren't interchangeable.

>
> Hi Francesco,
>
> The data sheet I was able to quickly find suggests optimum noise figure at a particular Vds, Vg2s, and Id, but does not mention the Vg1s required to achieve that Id. I suppose that for your particular part, you may need to run gate 1 slightly positive with respect to the source to get the 10mA. However, I doubt that there will be a significant advantage to doing so with respect to the noise figure. It will almost certainly be more important to adjust the input matching to achieve lowest noise figure.
>

righ, but on the datasheet there's no data about the right source impedance for best NF.

I'll have a look at the BF991 datasheet too, thanks for hint.
I have actually other spare mosfets like the BF960 and BF966, but they
seems worse than the BF981.

Thanks again
Francesco IZ8DWF

You're joking, right? I think if you took a survey of 25 or so hams here (or
in most other ham venues for that matter), you'd have a very difficult time
finding even a few who have anything close to $3,000 invested in their
hobby. Pile on me if I'm wrong guys, but pile on if I'm right too.

I'm guessing I have somewhere around $3000 invested over the 25 years in the hobby...let me do some rough math...Kenwood 520S $300, Kenwood 690SAT $1500, Yaesu 857 $600, Astron 35A power supply $250, MFJ 1278 Multimode Controller $300, Cushcraft A50-5S $150...am I there yet? Countless PL-259, N connectors, LMR400 coax, etc. BUT, I certainly know anyone can get by with a lot less investment. The key is investment over time. If I take my $3000 over 25 years, it only averages $120/year...pretty cheap for a hobby. I fly as another hobby and I can tell you that it costs more than $120 a year! ;)

That brought back a beautiful image from when I first got my license.
A couple of other teens in the same town got their licenses at the
same time.  One, in particular, was on limited means.  Very limited
means.  I remember going over to his house and being very happy for
him that he was working all over the place on 15M CW, using a little
one-tube regen receiver, parts scrounged from somewhere.  And I see no
```

reason you can't do the same sort of thing today, on CW at least.
Both the receiver and the transmitter can be simple and still be
effective.

Cheers,
Tom

Hello Francesco,

But I suppose that will be a problem no matter whether Id is 10mA or 7mA. ;-)

>
> > The data sheet I found was old and only seems to have summary data. I looked on the NXP web site, and found what seems to be a similar part, the BF991. The data sheet for it is complete, but it seems still very sparse. I am used to data sheets for low noise RF amplifier transistors that include graphs of things like noise figure versus input matching at some particular bias, and possibly for two or three bias conditions. It was a disappointment to not see something like that for the BF9x1 parts, though they may be good parts anyway.
>

At least the BF991 data sheet lists a recommended source impedance for optimal noise figure. I would guess that the BF981 will be quite similar. Of course, it will always be best to adjust for lowest noise figure.

I am not surprised that going between 9V and 10V made very little difference in the drain current. You certainly must be operating there in the "saturation" region of the FET (not to be confused with saturation in a bipolar...), where Id is very nearly independent of Vds, for constant gate voltages. Also, if you have a source resistor, that provides negative DC feedback and will stabilize the drain current--if the current decreases, the voltage drop across that resistor decreases, and Vg1s (and Vg2s) become more positive, thus tending to keep Id even more constant than it would otherwise be.

I would not do it myself, but if you feel a need to get Id up to 10mA, you could remove the "cold" end of the inductor from ground, bypass it to ground with a small capacitor, and apply a slightly positive voltage from a voltage divider. I think it is much better to just go with the 7mA or whatever it turns out to be for your particular part, and concentrate on input matching adjustments.

You didn't mention what frequency this preamp is for, did you? I am curious--is it for 144MHz or 440MHz or some other band?

Cheers,
Tom

yes indeed, unfortunately I don't have a NF test equipment to play
with, so I can't experiment too much.

having a way to measure it, of course.

That's right, I just checked what happened rising the Vd because it
was easy to do, and checking theory always helps.

>

I won't do it either, I just have the feeling that the particular
mosfet I have is maybe failing, but I would have to steal another 981
from a working preamp to be sure, which I'm reluctant to do, or use a
different dual gate mosfet like the 960 or 966 (I have plenty of them
from TV tuners).

>
> You didn't mention what frequency this preamp is for, did you? I am
> curious--is it for 144MHz or 440MHz or some other band?

70 Mhz, not a really quiet band actually, but I live in a quiet place
anyway. With a transverter tuned by ear (currently I don't even have a
spectrum analyzer) and a 6 element yagi home made I can hear very
frequent MS pings from beacons I normally don't hear. It's often
enough to tune a beacon frequency and turn to the right direction and
wait some minutes to get some pings and be sure everything is working.
If we get permission to operate on this band in the next years we
might be able to make the first TEP contact on this band. I don't
think a preamp would make a difference in my setup, but it surely
won't harm.

Thanks again and best 73
Francesco IZ8DWF

You can easily dump $3,000 into a single, contemporary, mid-range "box". I don't even look at the catalogs or QST any more for this stuff which is large, at least two big knobs, severa dozen other knobs/switches, and panadapter screen with fancy-schmantzy readout (digital send VFO freq, receive VFO freq, bandwidth graphics, etc).

But, over the last 30 years, yes, in total I easily dumped more than $3K into several VHF rigs, one UHF rig, several handi-talkies, a number of solid state HF rigs, amplifiers, old retro tube gear, some antennas (beams), rotators, SWR meters, antenna tuners....it all adds up. Easily, quickly.

Now, a guy can --it is possible--get on the air with something like a used TS-520 (good basic HF rig) dipole, coax, microphone, all bare minimum, for less than $500, maybe even less (520s maybe down to $250 these days, depending on how badly a guy wants to sell his). Me, yes, I have a 520 and an old Icom 707 (bought at a ham store for $400, and it is vintage entry level simple broadband rig from at least 20 years ago). And, a couple of boatanchors.

Francesco,
I have some better answers now, as I have a very complete BF981 datasheet in front of me.
1. For fixed Vg1s and Vg2s, changing Vds has no effect on Id. Just like you observed.
2. The *typical* Id for [Vg1s=0, Vg2s=+4, Vds=10V] is 11mA. The

minimum value of Id for the same bias point is 4mA. So your observed
7mA is within the process variation.
3. No the gates are not interchangable.
4. The datasheet does not give any Vg2s/Id curves, and Vg1s cannot be
positive (max gate current is exceeded nearly immediately) so you're
stuck with 7mA for this part.
5. Id *does* depends very strongly on Vg1s...for the typical part,
Vg1s=0V gives 11mA, but Vg1s=-0.5V gives Id=4mA.
6. Noise data is given at Vds=10V, Vg1s=0V, Vg2s=+4V: Fmin=0.6dB,
Gs,opt=0.6mmho, Bs,opt=-1.25mmho @ 100MHz.

The BF991 does look to be the same die as the BF981, just in the SMT
package.
GL,

Im trying to build a n amp using 4cx250s and need 6.0 volts for the
filament. The only transformers I have are 6.3. Can I just use a ballast
resistor to drop it down. My other thought was to wire another 6.3 volt
transformer as an autotransformer to reduce the voltage and use this to feed
the filament transformer.

Changes followed by "|".

The rec.radio.info newsgroup, first established in 1993, has been recently revived by an active moderation team. We are currently seeking suitable information, FAQ, and bulletin articles from the entire rec.radio.* newsgroup hierarchy for simultaneous cross-posting to our newsgroup.

We are seeking a replacement maintainer for the following information bulletin formerly posted to rec.radio.amateur.* (and currently archived at http://www.faqs.org/faqs/radio/personal-intro/):

radio/personal-intro
Subject: Guide to the rec.radio Newsgroups
Maintainer: jeffreyh@Hawaii.Edu (Jeffrey Herman)
Last Posted: 9 Nov 2001 06:18:17 GMT

Posting-Frequency: 15th of each month

We are willing to provide any technical support necessary to get this article updated and automatically posted again at a regular interval. This would include establishing contact with the original maintainer for any necessary permissions. We would prefer to seek a new, dedicated maintainer at this time, rather than start auto-posting the original article ourselves.

For more information about our newsgroup, see:

http://www.panix.com/~rram/usenet/rri/index.html

Please direct any comments, questions, or criticisms to
rec-radio-info-request@panix.com.

Seems like a resistor is a good idea. It doesn't waste much power, can be trimmed to get the voltage right, and has the added advantage of providing some limit to the current as the filament comes to temperature after being cold. 0.1 ohms (per tube) should do the trick if the 6.3V transformer really puts out 6.3V under that load. The power dissipation would be under a watt, and I've found 0.1 ohm 2 watt and 5 watt resistors in the past on the surplus market for very reasonable prices.

Cheers,
Tom

hmm then I surely damaged the mosfet when playing with gates
reversed.
I better find another one.

Thanks for the informations, If I had seen the datasheet before I
wouldn't ever have swapped the gates.
Now looking for another mosfet :-)

You don't need a second transformer; series resistance will do fine.

If it's two 4CX250s, then you need to drop 0.3V at (from memory) 5.2A, so the resistance would be 0.06 ohms. There will be some resistance in the connecting wires, but it's obviously difficult to make fine adjustments at such low values of resistance.

If the 6.3V transformer has no other secondary windings, a more convenient place to put the resistor is in the primary circuit. There you would need about 20 ohms to get the same effect, and this larger value is much easier to adjust. (The power dissipation of the resistor is the same in both locations.)

Either method will have some effect on the heater voltage regulation... but the higher-impedance supply allows you to make an interesting experiment: using a 4-digit AC voltmeter, you can watch the heater voltage slowly increase towards its final value over timescales of 1-2 minutes. You are using the tube's heater as a resistance thermometer to monitor the cathode temperature.

If the mains voltage is liable to vary - and above all, if you plan to use this amplifier from a generator - then it really needs an electronically regulated heater supply. Many amplifier builders have used a small switch-mode supply (look for a well-screened unit with good input and output filtering). Most 5.0V supplies can easily be cranked up to 6.0V, but some will need further modifications to prevent a large current surge through the heaters at switch-on.

Generally either just the wiring between the transformer and the tube
sockets, or the filament choke if operating grounded-grid, will
provide a drop of that kind.

Usually we hams find ourselves in the case of having too much drop in
our filament wiring. Strange that someone would think that the
opposite to be a worry :-).

0.3V out of 6.0V is only 5%. For a lot of medium to large-size amps on
household sockets (especially 110V), you see the incoming AC line
voltage drop more than 5% when you key up :-).

Some transformers have primary and/or secondary taps if you are really

```
picky about filament voltage.

Tim.

Hmm ok, I haven't yet desoldered the original one, I assumed it would
be bad when I read about the maximum gate current exceeded when Vg1s
is positive, which happened when I reversed the gates.

Thanks

Francesco

It was my understanding that the 4cx250s were picky about that extra .3
volt.

The 4CX150/250 series is picky about the filament voltage. It should be 6 volts.

There is an advantage in having a filament transformer higher than the voltage required by the filament. By using a series resistor, you limit the surge current - which means longer life. When you fire up the tube, the filament is cold and lower resistance. That means more current. But, with a series resistor, when the filament is cold and the resistance is lower, the resistor will limit current.

The Alpha 99 and 91B used a series resistor in the filament supply.

On Nov 6, 5:20 pm, nx7u <n...@cox.net> wrote:

...

> 3. No the gates are not interchangable.

That's generally true of dual-gate mosfets, of course. Gate 2 is similar to the control element of the upper transistor in a cascode. Thus, in typical operation, gate 2 has very little effect on drain current.

> 4. The datasheet does not give any Vg2s/Id curves, and Vg1s cannot be
> positive (max gate current is exceeded nearly immediately) so you're
> stuck with 7mA for this part.

?? That seems very strange. I would expect that, based on the diagram shown in the data sheet for the part, the current into the gate terminal would be very small up to the point where either the protection diodes turned on, or the gate oxide broke down. If the latter happens, you won't have any FET behavior ever again with that part. ;-) The data sheet says 10mA max gate current (the allowable gate current before the part is damaged), and that presumably is through the protection diodes. For the BF991, that would be at a minimum of 6 volts, and in any event should not be less than a standard forward diode drop. If Francesco has a circuit where gate 2 is biased through a resistive divider which would limit the gate current to less than 10mA, I would think there is no problem with having reversed gate 1 and gate 2, though of course it won't work as an amplifier that way.

Though it's possible to damage a transistor in a way that it will not work well as an RF amplifier but will still show normal DC behavior, I'd say it's very unlikely that's the case for biasing Gate 1 a bit too positive. So if the DC behavior is normal (nominal zero-gate-1-voltage drain current and decreasing drain current with negative gate 1 voltage; cutoff complete by -2.5V and likely somewhat before that; "flat" drain current with changes in drain voltage above the gate 2 voltage...), I'd expect it to still be OK, or at least worth trying in an RF amplifier.

> The BF991 does look to be the same die as the BF981, just in the SMT
> package.

In which case, I would expect no more than 50nA of gate-lead current up to 5V g-s voltage, at 25C...

Cheers,
TOm

All I'm saying is that with all the primary and secondary drops, not
to mention any sag in your house wiring, you may end up at exactly
6.0V when keyed up anyway. Give it a shot and if you discover you're
still 0.3V too high, then put in some dropping resistors (maybe just a
few feet of hookup wire). How many 4CX250's? They're about 2.6A
filament current each, so if you have three and need to drop 0.3V,
it's just 0.038 ohms.

Tim.

Please see http://www.beyondlogic.org/porttalk/porttalk.htm for the 'allowio
driver' for interrupt-based parallel port access. The 'JWA' logic analyzer
software 'digitrace' uses this on NT-based Windows with good results.
The logic analyzer software is at:
http://www.xs4all.nl/%7Ejwasys/old/ select 'DigiTrace' in the left frame.

Regards,

Michael

I had problems using allowio for a visual basic program I wrote... I kept getting a process ID of 0 no matter what I tried.

Also, I believe this does not work for Vista computers. Vista locks down a lot more of the computer system.

Hi,

I am looking for some help in understanding amplifier concepts (solid state only) and product specifications. I have searched for definitions and essays on the topic, but , having no electronics exposure, I find it hard to understand the concepts clearly. So if someone can please help:

1.   What actually is amplification of a RF signal: is it the scaling up of the amplitude?

I want to amplify a signal where the output has very low distortion and noise. It should be as close to the input signal as possible:

2.   Does push-pull setup mean that it's a class AB amplifier in which two amplifiers amplify the same signal, but the opposite two halves of the input signal?

If this is true, in an amplifier like this:
http://www.communication-concepts.com/ar347.htm

If two solid state amplifiers are rated at 600W each, and it's a push-pull arrangement, how come the output of this amplifier is 1000 watts (or 1.2 kw theoretically)
If one Motorola amplifier is amplifying half the signal, the other amplifying the other half, wouldn't the total output be 600W for the whole signal?

3.   In class AB amplifiers, is the output signal an exact replica (but amplified) version of the input signal?

4.   What is an octave when dealing with amplifiers?

5. Is this communication concepts HF 1000 watt amplifier a class A, class AB, or class C amplifier?
http://www.communication-concepts.com/ar347.htm

6. Does anyone know the detailed specs for this same communication-concepts 1000 watt HF amplifier?
Specs like:
a. Duty cycle
b. Phase stability
c. Phase change with power
d. Gain flatness
e. Pulse droop
f. Harmonics
g. Spurious
h. Rise/fall times
i. VSWR or load SWR
j. Gate delay

7 Can this amplifier be "controlled" to give graded amplification less than 1000 watts specified, or will it work only at this maximum level?

Any help is appreciated.

Thanks

Vijay

=================================
Or consider embracing Linux.
It might involve an initially steep learning curve , but a worldwide
Linux community is on tap to help.

I have used a lot of the A/B boxes. we use a lot of them at work and when they go bad I salvage the box.

Especially nice when you can use the existing connectors.

I have PC Board material - components and other stuff.

I have "some" parts for older equipment (ham/cb/2way) and even came into some "boatanchors" - inquire with needs. Not all is listed on web site - too much to list! Trying to clear stuff out. Monthly specials also available while they last. If I don't "have" what you need - I can check my resources to try to "find" what you need.

www.clfurlongenterprises.com

Thanks for reading - this is a one time post - unless replying to someone's request.

Hello Ralf,

thanks for answer but I don't need pictures of the radio itself, only of one particular board inside the radio.
I need to understand if a particular mod I found on the radio has been made by the previous owner or it's an undocumented mod made by the factory.

73

>
> 2. Does push-pull setup mean that it's a class AB amplifier in which
> two amplifiers amplify the same signal, but the opposite two halves of
> the input signal?

Take out the "class AB" from your above statement, and the answer is
"yes". You can have push-pull class A or C amplifiers as well.

> If this is true, in an amplifier like this:
> http://www.communication-concepts.com/ar347.htm
>
> If two solid state amplifiers are rated at 600W each, and it's a push-

> If one Motorola amplifier is amplifying half the signal, the other
> amplifying the other half, wouldn't the total output be 600W for the
> whole signal?

There are a number of reasons for not pushing the output devices to
their limits, and there is always a certain amount of loss in the
coupling network. Just because the transistor _could_ generate 600W in
the right circuit doesn't mean that every designer _would_ make it so.

> 3. In class AB amplifiers, is the output signal an exact replica (but
> amplified) version of the input signal?

We wish. Ideally, yes that is the case. Practically the output signal
will be filtered, delayed, and distorted but not too much.

> 4. What is an octave when dealing with amplifiers?

A two-times change in frequency, just like it is on a piano.

> 5. Is this communication concepts HF 1000 watt amplifier a class A,
> class AB, or class C amplifier?
> http://www.communication-concepts.com/ar347.htm

The page mentions that it's a linear amp, so it's probably class AB. Class A would be terribly inefficient, and class C wouldn't be linear. Communications Concepts builds amplifiers from Motorola applications notes -- your best bet would be to find them and read what the app note has to say. I _think_ that the high-end RF transistor line was retained by Motorola when it spun off On semiconductor, so you probably need to check the Freescale website (Motorola then spun off Freescale). It may now be an On part, however. If you don't find it, ask here.

> 6. Does anyone know the detailed specs for this same communication-
> concepts 1000 watt HF amplifier?
> Specs like:
> a. Duty cycle
> b. Phase stability
> c. Phase change with power
> d. Gain flatness
> e. Pulse droop
> f. Harmonics
> g. Spurious
> h. Rise/fall times
> i. VSWR or load SWR
> j. Gate delay

Check the app note.

> 7 Can this amplifier be "controlled" to give graded amplification less
> than 1000 watts specified, or will it work only at this maximum level?
>

The amplifier is linear, so it will have a more or less fixed amplification. To get less power out in it's linear region, just put a smaller signal in.

I like Tim;s explanation, but since it isn't real clear where you are heading, there are a couple other points I'd like to make.

> zdnet1111@rediffmail.com wrote:

[BIG CLIP]

> In electronics, amplification of _any_ signal is it's scaling up in
> amplitude or power.

Understand that theoretically, increasing the amplitude increases the power. The reality, especially with RF, and especially with solid state amplifiers, is not quite so simple. In order to transfer power from one RF stage to another, or from an output stage to an antenna, we need to match the input impedance of the following stage with the output impedance of the preceding stage. If the impedances don't match, not all the power will be transferred, and the portion that is transferred is likely to be distorted, perhaps badly.

I turns out that the output impedance of a solid state amplifier is dependent on the output power, with higher power implying a lower impedance -- often quite low. Generally, our antennas, and most larger scale modules, have, by convention, a 50 ohm impedance. (Internal stages often do as well, but there is no reason a designer might not pick something else 'inside the box').

Normal practice is to follow the amplifier with a matching network (typically still inside the amplifier box, however), so that the amp you buy has a 50 ohm impedance output. This matching network actually distorts the signal, really, deliberately. The result is what we want for a typical RF amplifier application.

Your question sounds a bit as if you might not be interested in the "typical" RF application, so the typical answers might not be quite what you are looking for.

[ANOTHER BIG CLIP]

> We wish. Ideally, yes that is the case. Practically the output signal
> will be filtered, delayed, and distorted but not too much.

And again, this linearity is right for typical applications, but again, for TYPICAL applications. Obviously, if an amplifier produces 1000 watts out with 100 watts drive, and it is linear, it will produce 500 watts out with 50 watts drive. But if you give it one watt drive, it might not produce 10 watts, and what it does produce might be quite distorted and masked with noise or other artifacts. Again, within reasonable limits, in typical applications, these things behave as you would expect. But in some odd application, or at the liimits of their useable range, the results might not be close enough to theoretical to satisfy you.

The same is true if your input waveform is not what one would expect. For communications service, the expected waveform is really quite predictable, and the design of the impedance matching circuits makes assumptions about these waveforms. If your input waveform is far from what would be expected, then you might experience a lot of distortion of the input waveform, even though a non-critical look appears to be within the operating range. For example, if you were to drive that amp with a 50 MHz square wave, the output waveform would probably look more like a sine wave than a square wave.

..

Well I've got all my TX problems sorted out fine now.
However I am beginning to think that the receiver is somewhat noisy.
When set up as per manual I am getting about a S3 internal noise level
on sideband.
My unit has had the RF stage modified as per the International Radio
mods and also the balanced mixer. In the next few days I hope to have a
look at this problem too, it is possible that the mixer balance is not
very perfect for example.
It was also fitted with back to back 1N4148 diodes across the RX input
and these might just have been damaged with the tx problem.
Has anyone else had a similar experience with this rig?
Regards Cliff Wright ZL1BDA ex G3NIA.

============================
Is it really the receiver ? Suggest you check by connecting a dummy
load inside a metal can . Are you sure that your house electrical power
wiring with attached equipment is NOT causing the noise?

So I ve notice, I have a program I use to control some relays via the
printer port and they dont work with xp. I still have an old computer with
95 on it. For that matter I still have a Pentium 1 with windows 3.1. I
wanted to be able to build my DDS before I had to worry about an interface.
Will probably eventually use a USB port to control it . For now Ive never
built anything using DDS or a PIC and one at a time is enough to learn
about. I do have an old Z80 prototyping board that I could use for an
interface. Its been about 30 years since I have done assembly language
programing for it but I figure a weekend in the books should get me back up
to speed.

Well Frank I've done just that. In the past I've had a lot of QRN from
"dirty" mains around here even if it is underground in this area.
So my first step was to ring the local power company.
However bad as it was when they had a faulty pole transformer about 600
metres or so away, it was variable according to loading etc.
This noise seems pretty constant under any conditions, just like the
noise from the mythical "Big Bang".
The mods I carried out are supposed to improve the noise floor of the
820S but although sensitivity is very good and any AGC action quietens
the noise considerably, I am still not entirely happy about the front
end of the RX. This is especially so as I have always been interested in
weak signal CW contacts on 20 metres especially to the Antipodes of New
Zealand in Spain and the western Med.
When it was done I had a few problems caused by a tiny solder bridge
on the IF board. This caused me to do a lot of messing around with the
front end before I found the problem as it had appeared to be RF stage
instabilty.
So I think that I will check out all the FET's and try and match even
more closely the pair in the balnced mixer.
Apparently Kenwood were not entirely happy with this circuit as
different units have at least 3 different source circuits for the
balanced mixer stage.
73"s Cliff Wright.

Well Frank I've done just that. In the past I've had a lot of QRN from
"dirty" mains around here even if it is underground in this area.
So my first step was to ring the local power company.
However bad as it was when they had a faulty pole transformer about 600
metres or so away, it was variable according to loading etc.
This noise seems pretty constant under any conditions, just like the
noise from the mythical "Big Bang".
The mods I carried out are supposed to improve the noise floor of the
820S but although sensitivity is very good and any AGC action quietens
the noise considerably, I am still not entirely happy about the front
end of the RX. This is especially so as I have always been interested in
weak signal CW contacts on 20 metres especially to the Antipodes of New
```

Zealand in Spain and the western Med.
When it was done I had a few problems caused by a tiny solder bridge
on the IF board. This caused me to do a lot of messing around with the
front end before I found the problem as it had appeared to be RF stage
instabilty.
So I think that I will check out all the FET's and try and match even
more closely the pair in the balnced mixer.
Apparently Kenwood were not entirely happy with this circuit as
different units have at least 3 different source circuits for the
balanced mixer stage.
73"s Cliff Wright.

Hello,

I'm looking for informations about the motorola VHF transistor M2528, datasheet or cross-reference. I can't seem to find anything useful on the net.
Thanks in advance

Francesco IZ8DWF

Remove ALL the mods. Take it back to original - that way, you will be looking for a fault rather than trying to figure out if its the mods, faulty mods, something else, etc etc.

The original design engineers had a pretty good idea of how it was supposed to work, published specifications in the manual, are based on this. Your battling with "mods" - how can find any fault with extraneous mods?

Get an established reference point, ie the service manual. Go forward from there.....

Andrew VK3BFA.

Generally, I'd agree- this would seem to be a job for an
industrial/research area (I know it's beyond my [admitedly limited]
abilities)> Yet, with 300,000,000 people in this country...never
underestimate what's possible.

"Never tell people how to do things. Tell them what to do and they will
surprise you with their ingenuity." Gen. George S. Patton, Jr.

Thanks for informations, looks like I need to guess. Indeed it's a VHF
(130-170 MHz) 12V device, power is unkown, looking at the case should
be in the range 10-20 W.
I'll see what mrf parts could be similar.

Francesco

All,

To transmit a video signal on a UHF or cable television channel
(signal will be low power and transmitted along a shielded wire to
other equipment), is all I need to do is mix an baseband video signal
(S-video) with the carrier of the channel in question? Or, is there
something more I need to do?

Not quite. In general TV signals are LSB reduced carrier with the audio as
an FM signal. The exact spacing between channels, and audio carrier frequency
varies from country to country. France uses AM audio.

ATV signals in the 430 mHz band are the same as TV signals, 1.2gHz and up use
FM video. I don't know about the 900 mHz band.

The easiest thing to do would be to take the modulator out of an old VCR.

Geoff.

Sometimes, at work, I need to make, or have made, an RF PCB board to
test an RF part. For example, a surface mount 2-way power divider, up
to say 4 GHz. We have regular g10? copper clad, a PCB millimg machine.
Is a 50 ohms trace about .1 in wide in this material? What is
advantage of FR and Duriod? Is TXLINE a good program to determine
trace widths? Any good books on RF boards?
Any tips would be very appriciated.

S-video is a component signal - it splits the chroma and luma. You're going to have to reassemble them before you can modulate it on a RF carrier, if you want a standard TV to receive it.

I don't think most amateur TV stations use a VSB lower-sideband filter. They seem to work OK - though they're generally going for legibility, not high picture quality!

The other suggestion, that you use a modulator from an old VCR, is a good one. In America that'll be VHF instead of UHF.

Xref: g2news2.google.com rec.radio.amateur.homebrew:1324

In the spirit of homebrew, I would prefer to repair what I have if I'm not building something new, even if the repair is on somthing commercially produced.

My Autek WM-1 (lighted version) "computing SWR/Power meter" seems to have quit "computing" in that it doesn't show an SWR reading.

In true "dont have a clue or schematic, shotgun approach fashion" I replaced all three ICs with high quality sockets and new ICs in case it was one of them. Also hit every connection with fresh solder in case of a hard to see cold joint. No Joy...

Primary Symptom: no SWR reading, PWR is OK.
When I reverse the cable connections, I see lower power, dependent on the SWR, so I know the match isn't perfect... Of course, swapping the cables only proved that I could vary my SWR and it wasn't 1:1, not that both halves of the sensor board are working, so swapped red & black wires on the sensor board end, tried sending power through both directions. Still no SWR, but at least now I know both halves of sensor board are good. Swapped wires at main unit end, checked again, now I know the wires from the remote head are good too.

Both meters seem to work fine, as I get the same scale deflection on each meter as I check them with a VOM in Ohms position. So now I'm down to one of the discrete components somewhere in circuit.

Is there a schematic out there for these units? I would much prefer to fix it myself than send it off to Autek. If nothing else, now that I've invested time in it, there is the challenge of fixing such a relatively low-tech device that's driving me to not admit failure.

If no schematic is available, then I will have to draw my own, (reverse engineer the circuit) and at my current rate of "spare time" that might take a month or more...

Thanks
-- Rick AH7H

I use APPCAD (free) to calculate line widths & impedances:

http://www.hp.woodshot.com/appcad/appcad.htm

For a given dielectric & impedance, the ratio of line width to thickness is constant, so thinner boards mean thinner lines for a given impedance. A 1/16" G-10 board requires about 110 mils of width for 50 Ohms.

G10/FR4 is OK up to several GHz, but it begins to get lossy and the impedance won't be as tightly controlled as with a "real" RF board material. It's OK to get a signal from A to B, but it ins't good for filters.

I don't know what's being used nowadays, but it is interesting how it
has been in the past.

Up till 1976, pretty much all articles about ATV would be about high
level modulating an existing transmitter. Do it that way, and the
only way to get VSB is with a filter that can tolerate the power level.

The one exception I've seen was an early sixties article in QST where the
author (a QST staffer if I recall) took the modulated RF output of a
surveillance camera and fed it into an upconverter to get up to UHF.
Likely that wasn't used much since it was more complicated.

Then in 1976, there was an article in "Ham Radio" about modulating
an oscillator running at about 50MHz, and then converting it up
and using a linear amplfication chain. More complicated but likely
put out a better signal than most ATV transmitters at the time. I
seem to recall there was even an LC VSB filter at the "IF" frequency.

I would have thought by now it had switched over to that sort of
thing, but I don't really know.

A lot or most of those RF modulators I've looked at have an SAW
filter, so I assume the output is close to VSB. Feed it into a
mixer stage, then some stages of linear amplification and there
you go.

Michael VE2BVW

If you know the Er (dielectric constant), and the thickness if the substrate, here is a nice website to calculate microstrip impedance...

http://www.microwaves101.com/encyclopedia/calmstrip.cfm

FR is basically just G-10 but fire retardant. G-10 is generally considered OK up to about 1 GHz. Duroid has a higher Er and thus thinner boards can be used and this will make a 50 Ohm line narrower and reduce the line's radiation.

The deadline for the ARRL homebrew challenge has passed and I hear that the ARRL received 4 entries, all NO computer radios. NONE were in the computer assisted category. Publication is scheduled for Feb 2008 QST

A Yahoo group was started to discuss developments.
http://groups.yahoo.com/group/ARRLHBC/

Some of the entrants have posting info about their entries there.

That's too high tech. I built mine on plywood and Masonite.

There is a writeup of my 811 project at http://schmidling.com/radio.htm

I need to update it but you will get the idea.

It is a single 811A modulated by a pair of them using two separate power supplies. Both supplies, RF Deck and Modulator are on wood. The only aluminum chassis is the VFO Exciter.

Complete with CBS Audio Chain and EQ, it is the best sounding rig I have ever owned.

```

Assuming "homebrew" includes "modifying a commercial product", I just did something that I'd like to pass on to others who might want to do the same thing.

I've had a Model MFJ-1701 "ANTENNA SELECTOR" switch for years. Basically, a rotary 6-position switch connects a "common" SO-239 connector to one of the six SO-239 antennas connectors while grounding the remaining five. Note that the "common" connector is always connected to one of the antennas, and the switch can NOT ground all SIX antennas, as might be nice when not using any of them.

I don't know if their current design is the same, but I got the bright idea that, if I removed the "stop" on the rotary switch, at least one of the new positions (there are now 12!) would ground ALL SIX antennas.

It was easy enough (remove four screws) to get into the box. I wasn't in the mood to un-solder the wiring, but by removing the knob and the nut which held the rotary switch to the box, I could bend the wires enough that the wafer came part-way out of the box. I would like to have just bent the "stop" tab out of the way, but my wire-bending didn't get the switch far enough out of the box to reach the tab with a pair of straight-tip needle-nose pliers (although bent-tip needle-nose pliers -- which I don't own -- might have reached), but a big pair of diagonal side-cutting pliers easily removed the stop.

RESULT: I now have a switch which can select one of six antennas and, in a seventh position, ground all six while leaving the "common" connector floating. (I use ANOTHER switch between this one and several rigs, and this second switch has an ALL-GROUNDED position, so when I'm not operating, all antennas and all rigs are grounded.)

This modification didn't cost a dime, and it took considerably less time to do it than to write this note!

Four entries? This does not bode well for the hobby :-(

IMHO, building at least some of your own stuff should be a prerequisite
for the license.

Cheers,

Part of the reason might be that building piece by piece is getting pretty expensive for what you end up with. For $700 or so, you can buy a radio that works all the HF bands plus 6, 2 and 432 with all kinds of features. Try homebrewing that for $700... :(Seems that most stuff homebrewed these days is station accessory equipment that just makes some task around the shack a little more convenient (I'm guilty of this as well). I do still hombrew all of my own antennas :)

Not really so Scott. Try the PicaStar group. By the grace of Analog Devices in their enlightened policy of providing samples of even their most expensive devices, and the price of SMD ((NOT really so difficult to work with, just different. And you purchase new resistors and capacitors at $0.003 each (Not a typo, 3/10ths of a cent) from DigiKey!)) Mine came in at something under half your $700 figure for a 160-10 meter transceiver with more bells and whistles than the average $2000 radio, and more performance than most radios costing twice that!

Well, Really not a typo, but at $0.31 for ten each, for the mathematically
unchallenged, that comes out to THREE cents each. Going to have to go sweep
up all those that have flipped out into never never land, hardly ever to be
seen again and restock my supplies. Them things is more valuable than I
thought. (Although I HAVE purchased SMD parts as inexpensively as $0.003
each at hamfests)

It's astonishing that anyone was able to meet the requirements: A $50 HF CW and voice transceiver meeting FCC spectral requirements. That's astonishing.

I mean, 40 years ago some of were cobbling together crystal-controlled CW transmitters for $10 or $15 plus a lot of raiding of old TV's and radios for tubes, transformers, etc. The fact that the same inflation-adjusted amount of money allows something that is way superior functionally with modern stuff is good news!

> IMHO, building at least some of your own stuff should be a prerequisite
> for the license.

Maybe, but requiring someone to build a multimode HF transceiver from scratch would have been even more onerous 40 years ago than it is today. Some folks will complain about the cost of a rig (and in fact these complaints were the impetus behind the homebrew challenge), but with used, all-band, multimode HF rigs available for just a few hundred dollars I don't see how cost can matter much.

There was a really funny letter that QST published over the summer, saying "there's no way to do anything on HF without a $6000 radio and multiple towers filled with beam arrays anymore". My response: I turned on my old Heath HW-16 (paid $50 for it a few months before) and worked a dozen European/Eurasian countries and Senegal without even trying. It's like some are setting the bar way too high or way too low, when really it's about having fun.

Tim.

IMHO one of the basic premises of the challenge - that the lack of sub-$50 radios is limiting access to the hobby - is the problem. After the designs are published and we don't see a huge influx of new hams, I think we'll finally be able to abolish the thought that sub-$50 radios aren't the silver bullet and move on to facing the real challenges instead of stupid lines in the sand.

That said, I really look forward to the clever things done to make a multimode HF transceiver for just $50.

Tim.

Well $50 is definitely Do-Able, for a SSB/CW radio.
There's a picture of one on the front page of the yahoo group.
http://groups.yahoo.com/group/ARRLHBC/

The fact that the are only 4 entries is a little disappointing,
especially since none were Software Defined Radios.
However, the task is difficult, and the prize was only a token $100.
I know of a few hams who started designs but didn't finish in time.

I've looked at the Picastar group, and that's real homebrew, they want
you to iron Xerox paper onto blank PCB stock to make your SMT boards. So
it's $300 in material, and probably 300 hours of your time. But saving
money is not the normal reason for homebrewing these days. For $300 you
could buy a decent used 160-10M HF radio on EBay.

The first radio I built (in the 60's) was a simple 1 tube crystal
controlled transmitter featured in an Electronics magazine that you could
build for $7. Adjusting for inflation, $7 is about equal to $50 today.
And for $50 you get much more: a VFO, digital readout, TX&RX, CW&SSB.

I think the point of the $50 HF radio, is to attract VHF only hams to try
HF. What's the statistic? 75% of all hams never operate on HF? The new
no-code license should let these Tech class hams get a general pretty
easily.

: In the spirit of homebrew, I would prefer to repair what I have if I'm
: not building something new, even if the repair is on somthing
: commercially produced.

: My Autek WM-1 (lighted version) "computing SWR/Power meter" seems to
: have quit "computing" in that it doesn't show an SWR reading.

: In true "dont have a clue or schematic, shotgun approach fashion" I
: replaced all three ICs with high quality sockets and new ICs in case it
: was one of them. Also hit every connection with fresh solder in case of
: a hard to see cold joint. No Joy...

: Primary Symptom: no SWR reading, PWR is OK.
: When I reverse the cable connections, I see lower power, dependent on
: the SWR, so I know the match isn't perfect... Of course, swapping the
: cables only proved that I could vary my SWR and it wasn't 1:1, not that
: both halves of the sensor board are working, so swapped red & black
: wires on the sensor board end, tried sending power through both
: directions. Still no SWR, but at least now I know both halves of sensor
: board are good. Swapped wires at main unit end, checked again, now I
: know the wires from the remote head are good too.

: Both meters seem to work fine, as I get the same scale deflection on
: each meter as I check them with a VOM in Ohms position. So now I'm down
: to one of the discrete components somewhere in circuit.

: Is there a schematic out there for these units? I would much prefer to
: fix it myself than send it off to Autek. If nothing else, now that I've
: invested time in it, there is the challenge of fixing such a relatively
: low-tech device that's driving me to not admit failure.

: If no schematic is available, then I will have to draw my own, (reverse
: engineer the circuit) and at my current rate of "spare time" that might
: take a month or more...

: Thanks

I am actually trying to send the output of a video card to a CATV channel.
I have VGA, S-Video, and RCA TV-out for choices.

```

> did something that I'd like to pass on to others who might want to do the same thing.
>
> I've had a Model MFJ-1701 "ANTENNA SELECTOR" switch for years. Basically, a rotary 6-position switch connects a "common" SO-239 connector to one of the six SO-239 antennas connectors while grounding the remaining five. Note that the "common" connector is always connected to one of the antennas, and the switch can NOT ground all SIX antennas, as might be nice when not using any of them.
>
> I don't know if their current design is the same, but I got the bright idea that, if I removed the "stop" on the rotary switch, at least one of the new positions (there are now 12!) would ground ALL SIX antennas.
>
> It was easy enough (remove four screws) to get into the box. I wasn't in the mood to un-solder the wiring, but by removing the knob and the nut which held the rotary switch to the box, I could bend the wires enough that the wafer came part-way out of the box. I would like to have just bent the "stop" tab out of the way, but my wire-bending didn't get the switch far enough out of the box to reach the tab with a pair of straight-tip needle-nose pliers (although bent-tip needle-nose pliers -- which I don't own -- might have reached), but a big pair of diagonal side-cutting pliers easily removed the stop.
>
> RESULT: I now have a switch which can select one of six antennas and, in a seventh position, ground all six while leaving the "common" connector floating. (I use ANOTHER switch between this one and several rigs, and this second switch has an ALL-GROUNDED position, so when I'm not operating, all antennas and all rigs are grounded.)

I've got a Citiphone radio that I don't think I'll ever let go of. Four
channels, and one (count it) watt. But it was my introduction to
user-supported radio. Too many memories. Might buy something else
though...

Thanks for the link.

Dave

I don't know where you are, but since you are posting from comcast, I'll
hazzard a guess that you are in the U.S.

My suggestion to you is to go to Radio Shack, or a store similar to what
they used to be and buy a modulator for a video game or DVD player.
You may be able to find one at a second hand sale, Salvation Army,
Goodwill, etc.

Take the composite output (RCA socket TV-out) and plug it into the
modulator and be done.

The VHF ones are usually fixed to channel 3 and 4 (with a switch), the
UHF ones are usualy tunable, but you may be able to "tweak" them.

Geoff.`

I'm not an RF collector by any means, but a HiFi guy and I'm sure I have
enough stuff kicking around to make such with a $0 output.

I did breadboard a tube SSB exciter for 27MHz... dunno of its spectral
purity but it got out *shrug*

Cheers,

Surface mount stuff is fine. I use them all the time in my transverters (VHF-microwave) and my other homebrew stuff. OK on your 160-10 homebrew. My example (my Yaesu FT857 is what I had in mind) covers that PLUS 6, 2 and 432. How much would it cost to add those to your radio? Probably not too much, but it might still get you close to the $700 Yaesu. And, yours is not counting labor costs. How many hours did it take to build? When I build, I "pay" myself at $20/hours...less than that and I stay in bed! ;) I know it's a hobby, but even if I don't count my labor costs, it uses up my time where I COULD be making $20/hour. Don't get me wrong, I still love to build stuff!!!

That's funny Scott. I put $20 an hour into a coffee can when I design/build
a project. Figure I couldn't have more fun if I paid that much for it. About
every 3 years, there's enough there for a 3-4 week vacation in the UK.

With Bush spending money we don't have like a drunken sailor, the dollar is
in the tank everywhere so it may be 4 years this time. Either that or I have
to build more stuff.

And I'll tell you, I am damned thankful that there are people like
Harold, and Bill Carver, and Martein Bakker, who set the bar pretty
high and give me inspiration to work on projects that will provide
even better performance--performance that you simply cannot buy
anywhere else at any price.  Largely through an understanding of the
goals that Bill and Harold, especially, have been working toward, I've
become rather rabid in my pursuit of excellence in certain aspects of
receiver behavior.

Cheers,
Tom

I'm one of the 4 who submitted an entry to the ARRL HBC contest. I figure I put maybe 500 to 600 hours into the project. I had relocated in February to take a new job, and my family wasn't able to join me until July. Consequently, I had the time on my hands anyway.

This may seem like a lot of time, but when you consider the average American spends that much time watching TV in four months, I don't feel too bad.

I consider it time well spent. I learned a lot that I will be able to use on future projects. I'm sure that the other contest participants would agree.

73 - Dave NM0S

I want to build a tunable UHF modulator for myself.   If I wanted to
be an appliance
operator I would not be posting on this newsgroup.

OK, don't mind if I do. Basically, my design is a direct-conversion rig, with a Class-E PA running about 90% efficiency DC-RF (CW anyway), delivering 5 to 6W PEP. Finals are push-pull 2N7000 MOSFETS, directly driven by a 74HC86 logic gate. VFO is a PTO covering the full 40M band. Voice mode is Double-sideband, suppressed carrier. There is an AGC on the receive, and ALC on transmit, so there is only one knob, for tuning. The receiver uses the PA MOSFETS as the receive mixer. The audio amp is discrete transistor design, with automatic bias control to reduce current consumption when no signals are received. Total current draw on RX is <30mA, on TX < 600mA. There is a 200 Hz CW filter that is switched in when a key is plugged into the KEY jack. Total parts cost, including enclosure and PCB is $40. Will work from 9V with reduced power.

ICs used are: LM324, LM3900, LM339, 74HC86 and 78L05

I'll make boards available if there is interest.

Hi Andrew.
Well I ran it for over a year before making the modifications.
These were basically using more advanced MOSFET's in the rf and balanced
mixer stages with some bias adjustments to suit.
From my measurements (I have a pretty well equipped home electronics
workshop) it did make some improvement to the internal noise floor and
about a 6 to 10 dB improvement in overload capacity.
I must actually beg to differ a little about the original design
engineers. As I pointed out the 820S was produced with a least 5
different 1st mixer source circuits in production and the coupling to
the balanced mixer is not optimum by any means. This doesn't look to me
like a fully optimised design!
BTW I did actually restore things the way they were and it just went
back the way it was, and the noise was still there.
Perhaps I should point out that I have designed and built 10 different
communication receivers in the last 40 years and have owned most of the
well known older commercial units too, in fact in the late 1970s I
worked 200 countries confirmed and got my WAC with a completely homebrew
station running 100 watts to a TT21 final.
Further investigation has confirmed so far that we have a serious local
problem with mains radiated QRN here.
Some experiments the other evening showed that the noise has decided
polarisation characteristics as a 5/8 wave 20 metre vertical produces
a similar noise level to my G5RV but with greater impulsive
characteristics, a bit like auto ignition noise.
The jury is still out but fortunately another local ham works for the
power distribution company and I'm going to get in contact with him to s

share our experiences.
Very dissapointing though as I have a nice elevated site and had great hopes of getting some good DX.
I'll post anything I find out further.

I recently purchased an older model HP8753 Vector network analyzer. It came with the reflection test set and calibration standards.

I have looked for some time on the net and cannot find any documents that describe how to make practical measurements.

Initially I want to characterise some passive components (caps etc) and I also want to be able to measure the unput impedance of an active device.

Can someone please point me in the right direction or maybe explain how I set up a test. I have seen responses in books showing the impedance of a capacitor and the self resonant response but when I connect a Cap to the test port on the reflection test set I can see the correct capacitance curve on the Smith chart display but when I switch to mag, the line is flat acorss the band. I cannot tell from the Smith Chart where it is self responant.

Thanks in advance for any help

Regards

David

I hear ya, man! My problem exactly! I can still afford to build
microwave gear but I can't afford the drive to get to one of the better
sites around here (about 6 hours away from me) :(

Us audio guys have enough parts to make one of these:
http://web.telia.com/~u85920178/tx/317-tx.htm

I just whipped one up the other night,did some testing on the top of the
AM BCB.. ;-)  A fun and neat little circuit.

================================
In the UK ,in order to obtain an Intermediate Level AR licence ,a
candidate ,prior to sitting a multiple choice type of exam (test) will
have to construct a (simple) piece of amateur radio related kit.
It can be as simple as a sounder to practice Morse telegraphy or perhaps
a simple receiver or a VFO or a crystal calibrator ,etc.
Prior to the construction the candidate will be assessed on basic
soldering / de-soldering skills.

======================================
I fully support that approach . Station accessories  can often be easily
home-brewed as can simple QRP equipment , and usually at very modest
cost .   All wire type of antennas can be readily home-brewed as well at
minimal cost using 'alternative' materials for insulators ,etc.

I gather your 8753 must be an 8753A. The one on my bench (8753E) has the two-port S parameter test set built in, an integral part of the instrument, so your comment about a separate test set surprised me at first. You didn't mention the model number of the test set (transmission/reflection?? You only mentioned reflection, but the ones I'm aware of are labeled t/r, I believe...). It's also not clear just how much info you DO have. A starting point is the Agilent web site, where you will find several different manuals in PDF format for your VNA, at least, and perhaps the t/r test set too. Hint: enter 8753A, not just 8753, in the search box, and select manuals for the type of info. I have an 8754 and t/r test set at home, and the photocopied manual I have for it does talk about how to set things up and make basic measurements. -- I just downloaded the 8753A operating and programming manual, and I have to say, it really doesn't cover making basic measurements very well. Try the 8753E User's Guide (doc. # 08753-90479) for some better info on actual measurements--or poke around a little and you can probably find even better ap notes and manuals for what you want to do. There's a lot there, not always easy to find.

I believe you should also be able to find ap notes on the Agilent web site about making various kinds of measurements. Search the literature for the 8753A first, but don't be shy about searching for ap notes on VNAs in general. I dare say you can even find some things on the Rohde and Schwarz or Anritsu or similar web sites, if you don't get overwhelmed by everything on the Agilent site. By the way, it's not always easy to tell from a Smith chart where resonance is, especially if it's not very high Q. Obviously, resonance may not be very near 50 ohms, and at extreme edges of the Smith chart, small distances can represent big percentage changes in impedance. The self-resonance in a capacitor may take the impedance down to 0.01 ohms or less, and it's very hard to resolve the difference between that and, say, 1 ohm on a VNA display. It may be more useful to look at a plot of phase versus frequency, and look for places where the phase goes through a large change rapidly.

Cheers,
Tom

According to kangaus.com, they were flooded and are closed for
business for the foreseeable future. As far as I know, they are the
only source of KK7B (Rick Campbell) kits- the R2, miniR2, etc. Does
anybody know where else I could find these? Thanks and 73,
Ross, NS7F

I STILL have a quantity of Test Equipment and Radio Communications Service
Manuals,
both Commercial & Amateur.
I started out with a LOT...but still have enough to prevent getting the
Explorer into the Garage!

Most of them are in Like New Condition.

Prices are reasonable...mailing may more than the manuals..depending where you live!

Please check my site: www.rodemi.com   for what is available.
Click on the MANUALS Heading.

I am updating the site as time allows.
I recently retired from the Commercial 2-way radio business and would like these useful manuals to find a good home.

Thanks for looking....Norm VE3CZI

For any one contemplating ordering from Norm - he is cool to deal with -
don't fret it. I just got a bunch of manuals from him and would deal with
him again - in a heart beat.

Lou

I've done some downloadable manuals over the years. Some of those he offered - I was unable to find - Googling and through some of the various manual sites. I got original manuals (a bunch of them) - in decent condition - from Norm, a lot cheaper than burning up my printer ink. I'm happy.

One of the manuals - I had gotten a "copy" of a couple years ago. It was missing some information, some was very unreadable - copied too dark. I paid almost the same amount for it as I did for the bunch - including the "original" which I "can" read.

To each his own. Everyone has a choice to make. I made one and am happy with it. Just leaving it at - Norm is a good guy to deal with - if you wish to purchase any of his manuals.

Thanks for the responses,

The VNA is the 8753A and the Test set I think is the T/R test set (Not S-Parameter).

I have all the manuals I could locate and understand how to select a Display format and sweep frequency range and do basic calibration "OSL".

The information I had trouble locating was examples of practical measurements. It seems that for anything I want to measure that I need to make a Test Jig and a set of standards that are the same layout as the test jig to CAL Open, Short, Through and Load. I also were not sure if I used the T/R test set when doing through measurements(ie. Test port to input of DUT and output to chanel "B" or whether I remove the Test set and go between "A" and "B" directly on the VNA).

One of the things I want to do is test Matching circuits and the input impedance of a SA605 IC but these are already on the actual PCB being used. Do I now need to make jigs specifically for this ? Or can I measure the device in-circuit ?

I think I know what I was doing wrong with the capacitor measurements. I was doing a reflective measurement and seeing R+jX when in fact the books show a graph of Insertion Loss V's frequency to see self resonant frequency etc.

I was also a little confused when the manual mentioned the T/R test set was used for measuring 50 Ohm devices but the devices I am measuring are not 50 Ohms. Maybe they mean that the Test set provides a 50 Ohm test environment ???

Thanks for any further comments.

I'll check out the manual for the "E" version and also for the 8754.

Regards

David Huisman

PB Wizz:

It's great that you're doing this!

Remember that 866s need heating time to vaporize the Mercury before applying High Voltage.
When I built the HV power supply for my "big rig," I put in a thermostatic time delay relay (which triggered a high current relay) to disable the plate transformer primary for about a minute, after the filaments went on.

Good Luck & 73

afcsman--W9NPI

Well things are in progress here. I've finally got the power company
looking at a 33KV line about 600 metres away. This seems to be the
source of most of the noise.
My fellow ham down the rad has exactly the same problems, in fact he has
taken down his all band vertical because the noise level it picked up
was so high. His multiband 3 el Yagi is somewhat better but then of
course you can use the front to back and front to side ratio to reduce
the noise pickup.
The powere boys are looking at the line right now and I am hoping to get
a quieter QTH in the near future.

Very interesting offering. Google did not offer to translate. Is there an
English page I missed?

Tnx,
Dale W4OP

> Well $50 is definitely Do-Able, for a SSB/CW radio.

If you were mass-producing a kit, it should be easy. The challenge (back when I read it) made it sound like it had to be buildable with printed instructions and $50. If you have to buy everything in single unit quantities and make your own PCB (or build ugly/Manhattan, a challenge that would seem more formidable than $50 to many new hams) then it's hard to squeeze everything in. How many tinkerers have any idea how much it would really cost to build one of their creations? They probably built most of it from the junkbox.

I've tried replacing the 2004 with 2002 to see their 144/50 MHz Xcvr page in
English w/o  results.
Looks like the 2004 is the only English page?

Looking for a transistor suggestion, for an RF receive pre-amplifier to cover 10Hz to about 60Mhz. So far, I have found a pair of 2N5109B bipolar transistors, which work ok in a grounded base push-pull design. These transistors provide a gain of about 12db over an input voltage range of 1 microvolt or less to over 4 volts. These transistors were designed many years ago; hopefully better transistors now exist which can provide superior linearity and better isolation form input to output. In addition, a spice model must be available.

Thanks.

Some of the best transistors for that sort of application are those designed for CATV amplifier service, where low distortion and low noise are important. Careful and creative circuit design can help a lot, too.

Your 4V input suggests you get 16V out at a gain of 12dB. Is that all at 50 ohms, and RMS? If so, that's about five watts output.

Have you measured IIP3 for your circuit? If so, what sort of performance do you get? What sort of noise figure? Can you share more details about the circuit?

Do you really mean input-to-output isolation, or output-to-input isolation? Normally, I'd consider +12dB in the forward direction to be poor "isolation" but in a direction I didn't really want isolation anyway--I want gain that way. You should be able in a push-pull circuit to add parts in a cross-coupling manner to lower the output-to-input isolation considerably, if that's what you are after. You can also run each side cascode (or in your case more literally, grounded-base into grounded-base...), and that can help the linearity and noise (as the input stage will run at lower voltage drop and thus run cooler), as well as the isolation.

I asked here not all that long ago about ideas for a low-gain, low-noise preamp with high IIP3 (and of course even higher OIP3) -- my mention of +55dBm as an IIP3 goal met with some disbelief (and one very respected suggestion for a way it could be done with some parts no longer readily available), but my thought is that it should be possible, given a fairly high power dissipation. Some of the modern op amps are getting close to being able to do it, at least through HF (30MHz); not to 5 watts output though. Not sure why you need that in a receiver. ;-)

Cheers,
Tom

Back when I was studying electronics in college in the 1970s, we were taught that a 1-Ohm resistor and a 1-Farad capacitor would create a RC circuit with a time constant of 1.1 seconds -- and that since it was physically impossible to make a 1-Farad capacitor, we would never actually see such a circuit in real life.

Of course, you can now order a 1-Farad capacitor for a few bucks from Digi-Key. But they didn't stop there.

On page 18 of this month's RadComm (RSGB) there is a brief item about "ultracapcitors". The devices are available in values up to 3,000 Farads.
 3,000 Farads. Amazing.

I can't find the reference I thought I kept, but some top-secret business plan is in action to use a giant ultracapacitor instead of batteries to power an electric automobile.

(Scratching my head in puzzlement...) one farad and one ohm give you
a 1.1 second time constant??

;-) I'll assume that was a slip of the fingers on the keyboard.

But even in the 70's, you could easily find computer-type
electrolytics with capacitances that were a very significant fraction
of a farad. I think I may have some around 0.1 farads with date codes
that old, and I'm just about positive I have some at 0.05 farads, and
not physically all THAT large, even. To me, a more impressive trick
has been to get the series resistance down to a low level. Early 1F

caps, used for clock backup and the like, had terribly series resistance. They were only good for delivering microamps of current, and they took a relatively long time to charge. Actually, that's not necessarily a bad thing with respect to charging, in that you don't need a series limiting resistor--it's built into the cap--to keep the charging current pulse under control.

Cheers,
Tom

Proposing to scrap some microwave ovens.
What uses are there for the power transformers?
Apparently these have 115 volt primaries and HV windings upwards of 2000 volts AC RMS.
Their power handling capacity must be of the order of 900 to 1000 VA (volt-amps or watts)?
1000 VA at 2000 volts indicates something of the order of 0.5 amps!
Wow; 0.5 amps even at say 230 volts indicates 115 watts or thereabout and the secondary (the 'old' primary) providing about 12 volts or thereabouts at around 10 amps or so, provided one has a 230 volt outlet available?
Any good (connected backwards) as a battery charger?
Ideas/criticism welcome.

I have seen two different designs for linear amplifiers, using microwave oven xfrms in the HV supplies. One of the designs even removes the HV secondary, and rewinds the transformer for the LV filiments.

Hooking them up backwards is most likely a very bad idea, as most oven transformers have one side of their secondary tied to the core. Never a good idea to hook up mains to such a design, due to risk of electrical shock.

You can also use them as a Hi-Pot tester. Connect the secondary as a voltage quadrupler to get 12 KV. Used for testing voltage breakdown. Check oyut Hi-Pot testers. They are current limited breakdown testers.

Also make reasonable good door stops. The primary wires can be formed into a carrying handle.

I dunno about using them 'backwards'...But if you rewind the secondary,you can get any voltage you like,and some serious current.

Good point: I had forgotten that.
I recall the few cases I've worked on them, one end of the HV
secondary IS connected to the frame and thereby to the chassis/metal
box of the microwave! Detaching it might be dicey if insufficient
insulation from what would then become the neutral of a 115 volt
input. BUT if used, in North America on 230 volts would be (one side)
or 115 volts RMS above neutral and ground!!!!!!
Thanks for the heads up on that. Terry.

Actually, ten colors available! 0-9 is ten, not nine. Sometimes I fall
into FORTRAN mode too so I won't blame you for being off by one :-).

I don't know if the Pomona parts are 100% identical, but I just
ordered a few sets from Digikey sold under the "Emerson/Johnson" name.
I'm guessing they're all made in China by the same company:

  http://dkc3.digikey.com/PDF/T073/P0372.pdf

Using color-coded Banana plugs/jacks seems preferable to having
massive crossbar wiring, at least in my head.

Question for anyone who has used the Weston CA-1630: Am I correct that
there are pushbuttons in many of the knobs and this is somehow related
to either removing the function of the knob (pin selection) or
selecting that knob's function for stepping during curve tracing
(grid, plate, screen)?

Really wonderful link to a big pic (may not work!) showing the CA-1630
set up to test a 300B:

Hi,

Do you know if there is a raisonnable cost or even open source RF system level simulator ? I mean a tool that allow someone to link boxes like generators, mixers, filters, gain blocks, etc, all defined by their black box parameters and simulate the system performances ? I know that high end tools like ADS have no poblem with that but I was wondering if there is something smaller, say just a little more powerful than the classic cascaded gain IP3/p1dB/NF excel spreadsheets ?

Thanks,
Robert

With wonderful toys like this available, made in China, the lead content should be checked!
Please, please do not put them in your mouth.

Hey, I grew up holding 60/40 solder in my mouth while plugging
krypton-85 filled regulator tubes in my left hand and turning knobs
just inches away from radium-filled meters with my right hand. None of
it made in china. And I'm perfectly normal!

Joking aside, it's pretty obvious that a test set with 1000V B+
running around obviously won't be in my kids' hands much less in their
mouths.

Tim.

I suspect the lead content on them is much lower than it should be.  The
Chinese are not exactly big into making quality phosphor bronze and most
of these sorts of parts coming from China tend to be made from cheap and
gummy cartridge brass.  That's okay for the socket, not so good for the plug.

The freeware RFSim99 will handle linear systems pretty well. You can define two-ports with whatever set of S parameters you want and place them schematically, and you can include passives and generic linear amplifiers.

It's possible to use Spice (e.g. LTSpice). It would be possible to define blocks including two-ports with specified nonlinearities and mixers, and be able to input parameterized things like gain, IP3 and NF. I've done some of that sort of thing for some system-level simulations I've done.

But I suppose neither one of those ideas quite hits the target you've put up...RFSim99 is turn-key but linear only, and Spice is potentially powerful but not turn-key for your application.

Cheers,
Tom

RFSimm99 is a very good program. I also use a program called AppCad, from
the HP Woodshot website. When you talk about those excel spreadsheets, I am
not sure if you are referring to these programs, but for freeware, they are
very good.
There is also a program called RF Workbench.........this is a DOS program
that has an interface similar to AppCad, although RF Workbench will also do
spur charts for mixers.

Pete

Many thanks, I will look into RFSim99 and RF Workbench. A colleague also talked about QUCS, which seems to have an interesting features...

Cheers,
Robert

This comming Sunday...
The Seasons Last...

+++ Now even more Buyers Parking !!!
Thanks to Shire we have use of their new parking lot
across Albany St from the SWAPFEST !!!

!! ** More Buyers PARKING is available ** for details see
http://web.mit.edu/w1gsl/Public/flyer

*** !!!! In our Traditional GARAGE and the adjacent lot !!!! ****
so come rain or shine or super heat the Flea is on !!!

********* $1 buyers discount with hardcopy of this notice ********

COMPUTERS - ELECTRONICS - HAM RADIO - COMPUTERS - ELECTRONICS - HAM RADIO

FLEA all SUMMER at MIT
Sunday October 21st 2007
9AM-2PM

Come to the city for a great flea - plenty of free parking.

MIT's electronics and ham radio flea will take
place on the third Sunday of each month this summer,
April thru October.

There is tailgate space for over 600 sellers and
free, off-street parking for >2000 cars!

Buyers admission is $5 (you get $1 off if
you're lucky enough to have a copy of our ad)
and sellers spaces are $20 for the first and
$15 for each additional at the gate.

The flea will be held at the corner of Albany and
Main streets in Cambridge; right in the Kendall
Square area from 9AM to 2PM, with sellers set-up
time starting at 7AM.

SEASON PASS + Advance Seller Discount

A sellers discount season pass is available which offers a 30% discount. By prepaying you get a discount and earlier admission. See the registration form.

*** Attention Sellers ***
Prepaid vendors.. Season Pass or monthly,
will be admitted FIRST.
Separate lines will form prior to gate opening
for prepaid and nonprepaid vendors

!! RAIN or SHINE !! Have no fear of rain, a covered well illuminated tailgate area is available for all sellers (6'8" clearance).

Talk-in: 145.23- (PL 88.5) W1BOS/R and
W1XM/R-449.725/444.725 (PL 114.8/2A).

Sponsors: MIT Electronics Research Society
MIT UHF Repeater Association (W1XM)
MIT Radio Society (W1MX)
Harvard Wireless Club (W1AF)

For more info / advanced reservations 617 253 3776

********** $1 buyers discount with hard copy of this notice ************

<<<<<<<<<<<<<<<<<<<<<<<< cut here >>>>>>>>>>>>>>>>>>>>>>>>>>>>>>>>>>>

Mail the coupon below by the 5th of the month to be a Prepaid Vendor.

FLEA at MIT 2007 Rates

SELLERS

To use your prepaid spaces the named vendor MUST be present.
Rates include one admission per space.

Advance $17 First space
$12 Additional Spaces
Must be received by the 5th of the month.

Gate Admission $20 First Space
$15 Additional Spaces
Admission is after the prepaid vendors

Early Bird Buyer -Admission after the prepaid vendor line is admitted. ~ 7:15AM
** You may not sell. **
$15 per person at the gate.

Just to chime in on this topic, I think some incorrect information was passed along regarding legality of transmission power - the FCC does in fact limit unlicensed maximum transmission wattage on the 2.4Ghz range, however the use of high gain antennas is NOT illegal. You can use extremely high gain directional antennas to achieve links over a 20+ mile LOS link, and still be within legal limits for unlicensed operation. Think of it as using as talking thru a funnel - all it is doing is using that same power more efficiently and more focused. Now if you are talking about running the signal thru and actual signal amplifier, then yes, that would be illegal.

2 cents

Unfortunately, this is also incorrect. The limit is for EIRP. The more focused the beam, the higher the EIRP.

The exact limit the U.S. is 1 watt EIRP for mobile devices and 4 watts

EIRP for fixed (point to point) links. That's a combination of transmiter power plus antenna gain plus feed line loss.

Ham radio is limited to transmitter output power, which is quite different.

It could be worse, the limit here is 100mW EIRP.

Geoff.

I am looking for schematics for a Tektronix 11A34 4-channel amplifier plug-in.

Inside the 11A34 are four smaller, self-contained amplifier modules, Tek part 119-2000-03... these are what I am really interested in.

I found a set of these amp modules, and it occurred to me that they might be good for some homebrew purpose. I figured I could mount them in a box with a power supply and use them as a external amp for an older scope, or possibly even a preamp for a homebrew receiver. In addition to what appears to be wide-band amplification circuitry, the modules also contain latching relays that I presume control input attenuation. I'm looking for signal descriptions for the terminal pads at the bottom of the modules.

I know that there are dealers that sell manuals, but I can't justify paying dealer price for a manual that may end up doing me no good. I'm simply trying to turn a few pieces of junk into something useful.

BAMA, by the way, doesn't seem to list this plug-in.

If you have any information on these parts, I'd sure appreciate it if you would pass it on. My email address is hpf[at]gainbroadband[dot]com

73,
Pete

I've been playing around with tube equipment since I was 17. I'm now
21 and building an old school transmitter. I'm running two 811 push
pull tube system, and the power supple is a ver impresive two 866 in
parallel system.

I'm hoping to have it finished by the spring, I have the power supply
finished and I look forward to starting the transmitter

Running a 32 km LOS link is problematic in practice. At least the first Fresnel zone should be clear of obstacles. At midpoint you should have about 30 m free space _below_ the direct optical path (i.e. you would have to add 30 m to the antenna towers), but still you should have 10-20 dB fade margins for reliable operation.

>power plus antenna gain plus feed line loss.

Assuming ordinary +20 dBm cards with 16 dBi antennas at both ends, you would end up to the +36 dBm EiRP (4 W) transmit power. The free space loss at 32 km and 2.45 GHz is 130 dB, so the receiver would get -94 dBm, which is very little for broadband traffic, especially that figure does not contain the fade margin. In fact using +10 dBm cards and 26 dBi antennas would give 10 dB more receiving power.

>Ham radio is limited to transmitter output power, which is quite different.
>
>It could be worse, the limit here is 100mW EIRP.

If you can find a WLAN card with separate Rx and Tx port, put an omnidirectional antenna on the Tx port and a 2 m paraboloid (30-33 dBi gain) on the Rx port and quite long point to point systems could still be built. Of course any interference within the beam would also be picked up.

Which puts you right at the legal limit for the U.S. If your transmitter is slightly higher power, or the antenna is more efficent you go over the limit.

If I understand you correctly the EIRP would remain the same?

Around 1980 I worked a place that used IR beams for high speed (4800bps), data and it worked until someone built a hotel in the way. :-)

Geoff.

I understand that there's another issue with long links which can cause some problems. 802.11 cards are designed to automatically acknowledge packets received, and retransmit them if they aren't acknowledged promptly. This retransmission protocol is done by the card firmware, and occurs below the level of any operating-system packet acknowledgement or retransmission (e.g. TCP).

The automatic-retransmission timeouts in the cards are set to a fairly short time-period, in order to improve throughput under typical usage conditions.

A 32 km link is going to have a round-trip time of around 200 microseconds. If the transmitting card's timeout value is set to less than this, it'll start retransmitting the "lost" packet before a successful acknowledgement can come back. Lather, rinse, repeat.

Traffic will actually get through, I gather... the successfully-received packets will be forwarded to their destination, even though the sending card thinks that they haven't been received (and logs them as "discarded, excessive retransmits"). Throughput suffers badly, though.

Some cards and/or access points apparently allow the retransmission timeout value to be changed, to allow for sufficient speed-of-light travel time.

Fade rates typically vary between a few times a second to several
days, thus resending a frame one millisecond after the initial frame
is not usually going to make a big difference, if the initial frame
was, say 10 dB below the threshold (i.e. deep in the noise).

While COFDM and various spread spectrum systems will help combating
(fast) frequency selective fading, but these do not help in slow fade

due to varying vertical atmospheric temperature and humidity profiles.

You still need the fade margin for slow fading, if reliable communication is required.

The situation is different in typical amateur radio usage, in which you are most interested in rare situations, in which the signal strength increase above the average signal level, thus increasing the communication range in rare occasions.

New in this version,

1. Improved log file replay, with the ability to apply track list and filters during the file loading process to reproduce different tracking scenarios, and the ability to adjust replay speed,
2. Added TCP raw data window, and option to turn it on/off for better performance,
3. Improved subnet filter handling,
4. Streamlined filter, settings, and track options interface, plus other enhancements,

Visit www.aprspoint.com for more details and download.

The latest issue of QST ha a interesting article.

It seems that soldiers today are carrying up to 40 pounds of batteries for all the gear they carry.

The US Army, looking to reduce this load, is seeking a portable power supply.

This proposed unit must provide 20W output for a minimum of 96 hours, and weigh less than 4 kilos (about 8.8 pounds). The design contest is open to all, and the designer who comes up with the best design wil receive $1,000,000.

See Oct. QST for further information.

Hello,

I've been "designing" a Philips TEA5757-based radio by fitting readily available components (i.e. from Digikey or Mouser) into the outdated application circuit. I'm currently stuck on the FM front-end tank circuit; I'm not quite sure I understand how it's done in the application diagram (page 27 of the TEA5757 datasheet). By my calculations, it shouldn't work.

The tank consists of a dual varactor (BB804), a 10 pF trimmer, and a RF coil that I cannot find the specs for (Toko MC117 E523FN-2000242). The schematic says the coil has 38 pF capacitance, and from comparison with current Toko coils and googling I'm guessing that it's an unshielded coil with a Q > 100 and an inductance < 100 nH. From the BB804 datasheet, each individual varactor has an effective range of 20-60 pF (generous assumption given 12V supply), so the series combination results in 10-30 pF.

Altogether, the capacitance range is 48 to 68 pF, and 68/48 = 1.42. We need (108/88)^2 = 1.5 to tune the FM radio band. Stray capacitance and the trimmer don't help. I doubt Philips would provide a bum application diagram, so I must be missing something.

Thanks,
Mike

Hi Mike,

Digging for data on the Toko MC117 series... http://81.149.89.17/Pages/MOLD/
page91.htm

The E523FN-2000242 isn't shown, but there does appear to be a
relationship between PN and inductance (2xxxxxx indicates 2.5 turns)
which seems to be in the 55-66nH range.

Hope that helps a little bit.

Regards,

Mark

Just a wild guess, but the 38 pF may be the capacitance required to be resonant at 100 MHz. Inductors below 1 uH rarely have parallel capacitances above 1 pF. And remember that 10 pF is a variable trimmer.

Put this into your assumptions and see how it works.

You can try the Motorola Canopy system. We, at work, use both the 5.7 GHz
and the 900 MHz systems and get a good 20 to 30 KM range. The web site is
http://motorola.canopywireless.com/solutions/

You didn't tell us what bands this was going to be for. Higher frequency
might need neutralizations.

2x811 in push-pull? Probably grounded cathode, but you didn't mention that
either. It is possible to run grounded grid push pull, but it's rare.

Ah, that makes a lot of sense. I was under the impression that these
coils had built-in capacitors, but after comparison with other Toko
datasheets, the ones that have caps say "available with internal
capacitance".

With the new numbers, the capacitance ratio is sufficient, but the
required inductance comes to around 100 nH. That sounds reasonable to
me.

Thanks for the help,
Mike

Whenever I build something like this I often put it in a fairly oversized case to leave room for future mods and add-ons. Old instrument cases are a favorite.

I have a couple of graphic equalizers I would like to modify for amateur radio use.
They cover 12 bands are all but useless for radio work because each band is much to broad as well is the overall bandwidth. I want to narrow it down so that the overall bandwidth is about 3Khz and the 12 bands equally devide to fill this. It seems I saw an article about such a project several years ago.

> Anyone know where I can find a 12V AA (8-cell) battery case w/cover, for my current homebrew project? I had a good 9V case, but took it out when I decided to move to 12V. Currently have a crappy looking 8-cell case without cover, and am seeking something more professional looking. May go back to the 9V (6-cell) case w/cover. Or just live with the crappy one until something better comes along.

Put the crappy looking holder in plastic freezer box or something similar. I have one in a small case that came with an assortment of nuts and bolts. It opens from both sides. Battery pack on one side, camera stuff on the other.

I want to build something like this but without the PIC interface. Instead I want to control it directly from a printer port. I am looking for examples of software that can talk to DDS chips in this manner. As a matter of fact I plan on building the device so that the whole thing will fasten to the printer port or possible mounted internal to the PC. Any help would be greatly appreciated.

Jimmie

For L in uH and C in PF, the LC ratio at 88 MHz is 3.27. The LC ratio at 108 is 2.17. If Cmax - Cmin is 10 PF, then L= (3.27 - 2.17)/10 = .11 uh. That means Cmax is 3.27/.11=29.7 PF and Cmin=2.17/.11=19.7PF. Sanity check:
Cmax - Cmin = 29.7 - 19.7 = 10 PF; qed.

If they say a 100 nH inductor has a capacitance of 38 PF, that is a garbage statement.

Pictures?  If you have a web site, or if you can post to one of the
public picture sites, that would be very cool.

I'm twice your age and haven't gotten around to building a tube
transmitter yet, although I've rehabilitated some SSB tube gear and used
it on the air.  I hope to make something from scratch before I keel
over, but it may have to wait for retirement, or at least for the kids
to get off to college.

Good luck to you!

Thanks but by "example of software" I meant source code so I can learn how
to write the progam I need to control it so the controls may look like a
transceiver or a signal generator.

Jimmie,

It's a good point as I bet I'll coming up with mods. This little beast is on a 5.5 x 3.5 inch PCB and I'll have more than twice that area to play with in the case I've decided on.

Charlie.

I used a CB amp on the ham bands after building a filter that was nothing
more than a PI-net impedance matching tuner. Being a tech plus at the time I
only used it on 10M and the filter/tuner was only designed for 10M. Output
was very clean but a lot of this was also due to proper biasing of the amp.

If you really want it to look impressive build it on some old telco open frame racks. I built my first stereo amp like this. Some people were afraid to enter my bedroom and rightly so. A lot of the equipment had plate caps exposed.

You are right. Actually , I did think the same as you did, but 100 nH and 38
PF works out to about 82 MHz, which is overkill. You only need to go as low
as about 87 if you want to include CH6 audio. He will want to use a varactor
with about a 3:1 capacitance ratio to allow for stray and fixed capacitance.
In my example a (5 - 15) PF should be doable.

Not to put too much of a damper on this, but I've looked into it and it's clear that there's no trivial "off the shelf" solution that you can point to and claim your million dollars. :-) This prize isn't going to be won by someone tinkering in their basement -- it'll end up going to, e.g., some researchers at a university with good connections to industry.

Hello,

this is probably a bit OT here (any better group?). I'd need a picture of the RF-Unit of a FT-707 (lot 11 or newer). The unit should be PB-2201 (older sets have another board) and is located under the top cover. The unit can be flipped by removing 5 screws and without disconnecting any cable. I'm trying to determine if a mod I found there is from the previous owner or from Yaesu itself and also trying to fix the rig which has an exceptionally large set of faults. The rig should have an unmodified (and never modified if possible) 40m band (7 to 7.5 MHz).
The email address is valid.

Thanks in advance

Francesco IZ8DWF

Putting 2KWH of controlled energy into a <10# package is going to be a
real trick... Not doable with todays electrical containers - no matter
how fast that damn rabbit beats the drum...
Off the top of my head (along with flies, fleas, and dandruff) I
predict it will not be a rechargeable battery...
It will either be a version of a fuel cell with compressed hydrogen as
the fuel..
Or it will be a version of a primary battery with an erodeable anode -
for example an Fe-Cu cell with vinegar electrolyte, but likely using
lighter metals - Lithium comes to mind, of course...
When I first read this I made a mental note to look up and calculate

how many gms of copper would have to be sacrificed in an Fe-Cu cell to generate 2KWH, but life intervened and I haven't gotten back to that (and likely won't) so I throw it out for thinking by those with a bit of chemistry background...

denny / k8do

An ISP in my area has a rather large wireless network established, probably 30 miles from main office to my end of their network. I am at the far end of the network, about 12 access points "deep", meaning my traffic hops through 12 bridges-access points (repeaters) before it reaches the ISP's backbone. It works fairly well for internet browsing, better than I would have thought, but I've never tried internet telephony or video conferencing. That ISP is using 802.11b radios throughout the network, so the network certainly can't handle a lot of internet traffic, but it works.

The general problem is going to be that WINXP, 2000, Vista, and NT make it difficult to use the printer port pins directly. Not impossible, but certainly a problem.

You could use something like a PIC877 or some such to act as a serial input which would then allow using Rs232 to communicate from the PC to a radio.

Alternatively, use WIN98 and the printer pins are "up for grabs" with fairly simple PC programs.

Hi,

Thanks for the reply. I have the PCB and PIC. here is the link
http://www.hamradio.in/forums/viewtopic.php?t=857 have a look.

Just an update for those who might be interested.
It turns out that my reservations about valve (tube) Testers were proved
to be correct.
I used a single 6883b in the final amp and got the following very
interesting results.
Tube 1 for a dc input of 84 watts the RF output was a miserable 25 watts
measured with a calibrated Marconi RF power meter.
Tube 2 for a Dc input of 63 watts the RF power was the same, vis 25 watts.
25 Watts is the maximum power rating of the Marconi test equipment.

So it is very obvious that damaged or low emission finals can have the effect of drastically reducing the efficiency of the Power stage. Fortunately I hope to source some more 6883B's or 6146B's this weekend.

So if your transmitter gets "feeble" but the Dc input remains the same suspect your finals. Especially if it tends to red hot anodes!!!

Greetings:

I am in need of a set of Drake knobs for an R4C (complete set needed including the tuning dial) and (1) extra accessory knob for a T4XC (the "XTAL" position)

Please RSVP direct to "stevenrobeson@yahoo.com" with condition and asking price.

Thanks!

I got one at swapmeet with a problem.  It works fine on the Short side
but on the Open side on check the eye stays open instead of being
closed.  The wiring and tube seem OK.  The schematic I have shows a 5mmf
cap across the osc coil but I don't see one and wonder if it was missing
from the factory because the parts list doesn't show a 5mmf cap.  I'm
guessing the coil came with both caps as an assembly or my unit is a
later one and they may have figured out a way to wind the coil where
they don't need it.  Anyone know?  Scoping the grid I can see a flash of
high freq. osc momentarily but that's switching in the Short side.
tnx

The manual I have for the CT-1 shows a 10 pf capacitor across the oscillator coil, however, it's not in the parts list either. The oscillator coil must have come from the factory assembled with a tuning capacitor that made the circuit oscillate at the correct frequency.
Do you have a complete manual that gives the circuit theory of operation? That section describes both open and short checks as well as normal operation. If not, I can send you a PDF of the manual.

Cheers!!!

Gentleman in Geneva, IL area has NOS of these knobs.
Usually posts auction on eBay ~ $35 for a set.

Dave
Thanks for the offer but I have a manual copy that seems to be god
enough..
I'm hoping some one who sees the post and has a CT-1 has the time to
take a look inside to see if there;s really a 5 mmf cap across the coil.
Right now I'm trying to recall what junkbox of my many might have one..

Henry, I just opened mine and it has a 10pF NPO ceramic across the end
of the coil opposite the green dot [the left end looking from the
rear]. The frequency of the oscillation in not as critical as it
operating over the range of loads, so I should try 10pF and see how it
works with a variety of capacitor values under test. If it craps out
at either end of the load range, try 5, 15 or 20pF and see how it
goes.

Neil S.

Hi Neil
Mine has the 10mmf  on the end opposite the green dot..
But my schematic shows a 5mmf across the big coil which mine doesn't
have..
Does yours have a 5 mmf on the coil as shown on the schematic and in
Fig. 3 page 11?
tnx
Hank

The CT-1 uses an oscillator tuned to approximately 19 MHz for the open test.
It does not matter if it is 21 MHz or 17 MHz, and there will be no
difference between a 5 pf or a 10 pf or no pf across the coil.

If no one got offended, I would say that you are barking up the wrong tree. But, I do not want to hurt anyone's feelings, so I will not say that. My dog would not get her feelings hurt if I talked like that to her, but people do.

The problem is elsewhere.

One of the problems, when you pick up something that does not work, is assuming that it ever worked. Sometimes kits were assembled, and did not work, then put on the shelf where they languished for decades.

Check the wiring and check to see if the oscillator is oscillating. Sometimes switch contacts are wired incorectly. Sometimes switches are improperly cleaned then fail Sometimes resistors fail.

In the past, we check the paper and electrolytic caps. Now, we may need to check the mica caps.

Colin K7FM

good statement - don't assume it ever worked - at one time I made my spare change fixing kits that the purchasers couldn't assemble correctly.

Red hot anodes still doesn't sound right, Cliff. Did you have to turn
the bias pot to any unusual positions to get them to glow like that?

Weak emission tubes just don't draw much current, and even if I
cranked the bias current up to normal while their output would be
feeble I generally find their plates to be sucking current anemically
when they're low emission. Now, gassy tubes, especially if there is
enough grid current to upset the grid bias, that is a problem I've
been having with NOS tubes lately.

What's the grid voltage when you're done biasing? For my "good"
6146B's, it's almost always -50V in AB1. -75V or so is class C. If you
are setting the bias to something closer to -30V or -40V, I think
you're getting closer and closer to class A.

I remember spending a few weeks allowance on some known good 6146B's
when I was a kid. Are known good final tubes that hard to come by down
under? I'm starting to feel like I should send you some of mine just
to help you in your struggles :-). Besides, I'm mostly using 807's
here except for my Eico 720 these days!

Tim.

Hi Tim.
Yes the bias is correct as are all the other electrode voltages. I think
that you are correct in thinking that the tubes are no longer "Vacuum
Tubes" but more akin to 1920's soft types.
I'm pretty sure that the problem originally began with a loose ground
connection on the UHF antenna output cable.
This meant that the final was running into a terrible mismatch.
BTW over my 50 years+ as a Ham I've built several linear amps, including
ones using 811A's, 807's, 6146B's and even TT21's. I'm still of the
opinion that all these transceivers with class AB1 linears need a meter
position to measure grid current. In my experience the best way by far
to ensure proper operation in AB1 is to keep it from flowing!
As to relacements, well I hope to get some from a local "junk sale"
on Saturday next. The 6883B's have 12 volt heaters and were often used
in old local AM and SSB mobile radios by small ships and the forest
service. That means that there are quite a few around in NZ. Just as well!
The Kenwood is designed for a Japanese equivalent to the 6146B but a
simple mod to the heater wiring on the final PC board makes it possible
to use 6.3 volt or 12 volt heater tubes.

Hi Tim.
Yes the bias is correct as are all the other electrode voltages. I think
that you are correct in thinking that the tubes are no longer "Vacuum
Tubes" but more akin to 1920's soft types.
I'm pretty sure that the problem originally began with a loose ground
connection on the UHF antenna output cable.
This meant that the final was running into a terrible mismatch.

BTW over my 50 years+ as a Ham I've built several linear amps, including
ones using 811A's, 807's, 6146B's and even TT21's. I'm still of the
opinion that all these transceivers with class AB1 linears need a meter
position to measure grid current. In my experience the best way by far
to ensure proper operation in AB1 is to keep it from flowing!
As to relacements, well I hope to get some from a local "junk sale"

I am trying to establish a wireless network for Internet Access, Video
Conferencing and Intranet Applications, I though to use either a
2.4GHz Sector or Omni Directional Antenna would do the job but I can
find any product that goes as far the distance I am trying to cover (a
radius of 20Km). My idea is to use a powerful radio with the Antenna
monted on a tall mast at the location of the internet feed (via VSAT),
this location is idea for LOS at the other locations.

Does anybody has experience/advise with this ?

for such application you will need on both sides approx. 80cm (offset
used Sat) dish with properly mounted a proper feed to it; visual line
w/o obstacles in-between is a must ! get some clues:

It's probably illegal. In the U.S., EIRP limits are 1w for portable/mobile units and 4w for fixed (point to point links). For example, the infamous Pringles can antenna is at the border of illegal for point to point links, and is definately illegal for mobile or portable use.

I don't know what the EIRP limits are if you are out of the U,S. here in Israel it's 100mw, effectivly making gain antennas without a long (high loss) feed line illegal.

About the only way to do it with such a wide radius is a MESH network and gain antennas with 10db (10x) gain. Using a transmitter power of 100mW (which is the standard), you will be just at the limit. The extra gain of the antenna will also help increase the range of the remote units.

A cheap MESH network can be but together using Linksys WRTG54-L routers (note the "L" suffix) and third part firmware such as TOMATO (www.polarcloud.com).

You will need to do some inteligent design of the network, you want to MESH with the least number of hops to your Internet connection.

20 KM, is an awfully long range for a MESH network anyway. If you have a reliable range of 150 feet (50m) per node, and place them 300m apart, a strip 20km long by 100m wide would need 50-60 nodes depending upon terrain, buildings, etc. With a possible 25 hops between a remote device and the Internet, latency would be too high (it would take too long) for VoIP or videoconferencing. Web surfing, email, file transfer, data telemetry, would probably be ok.

WiMax would be better, if it delivers on promised performance, you would be able to place your nodes as far as 4 miles apart (2m range).

Meanwhile if you can combine a MESH and fiber optic network, you would get much better results, but at a much higher cost. You no longer would be able to use cheap routers and there is the cost of the fiber.

Geoff.

"Yeahbut" the tubes probably took that mismatch in style.

It was probably another failure caused by the mismatch that started
the cascade of problems. I'm guessing an arcover in the plate blocking
capacitor and/or the final choke. After that happens I could easily
believe the tubes glowing a nice bright blue inside and other stuff
going bad (usually visibly and stenchily but not always) in the final
compartment.

An -820 is in my head still an "almost new" radio, BTW :-). I am
willing to believe some grounds failing somewhere. If I saw a burnt-
through PL-259 or piece of coax I'd be willing to believe a bad ground
in a cable.

You will note that you keep on coming back to the tubes... and I keep
on fingering other stuff in the final compartment.

My gut feeling is that if you can get the tubes to draw enough current
to make their plates glow a bright cherry red, then it's hard to blame

tube emission as being deficient. You've still got something else going on that's preventing you from loading up nicely, and while you've traced out some problems with your DC metering already I'm not convinced that those were the only problems in the final compartment.

Tim.

Actually Cliff I'm not really convinced the tubes are bad. If you
trace out the DC plate and screen current with respect to grid voltage
(I'm sure you're very familiar with the bias pot by now) I think you
might convince yourself this isn't a soft tube problem.

If you can momentarily change the grid bias from -50V to -20V or so
and see the plate current go from fifteen-twenty mA up to 200mA, then
I'm sure that the tubes aren't soft. Keep the plate current at 200mA
for more than ten or so seconds, though, and the anodes might start
melting, so this is purely a momentary exercise!

Tim.

20Km isn't at all a long distance, IF one uses High Gain antennas on both ends of the 2.4Ghz link. My T1 Phone link runs 20Km using Part15 Devices (LynxBoxes) and 6 Ft Parabolic Dish Antennas on each end.
We had to install a 6DB Attenuator in the Feedline at both ends of the Link, just to keep the RSL in the AGC Range of the Receivers. One just needs to understand the parameters of the Path being used, and the hardware required to make the Path work with the appropriate Path Losses involved.

This is an Unlicensed Link owned and operated by ALASCOM, our Longlines Carrier.

It also is colocated with a WiFi Network of Access Points that distributes IP Traffic to our local community, which I own and Operate. It is a matter of RF Engineering. Get that right, and things can be worked out.

Anyone know where I can find a 12V AA (8-cell) battery case w/cover, for my current homebrew project? I had a good 9V case, but took it out when I decided to move to 12V. Currently have a crappy looking 8-cell case without cover, and am seeking something more professional looking. May go back to the 9V (6-cell) case w/cover. Or just live with the crappy one until something better comes along.

If anyone knows where I can find an 8-cell AA battery case w/cover, I'm all ears.

Thanks,

Dave

I think the O.P.'s problem is regulatory issues regarding EIRP
in his country preventing him from using hi-gain antennas.

Regards,

Michael

I checked mine and the schematic does not show any cap across the
'large' coil, nor is there one. You might check the cathode for
oscillation activity since virtually any capacitance across the
secondary will kill the oscillation [even a 'scope probe]. There is
not a whole lot in there to go wrong, so you might check the eye tube
triode for emission; if it is weak that could be a problem, or if it
has been inactive for a long time. Mine has not been used since I

refurbished it 10 or so years ago, and it worked immediately I turned
it on and the tube warmed up.

Neil S.

As I understand the problem, the network would cover an area with a 20Km
RADIUS. You include a reference to an omnidirectional antenna and a
"powerful" radio, with the base station antenna mounted sufficiently
high to be line-of-sight from the end-users.

My thought is that you are a bit naive, describing a one-way system
similar to a Television or FM Broadcast Station. There are existing
systems used for providing community internet access, and I don't think
that is how they work!

While I'm not familiar with the community systems, there are technical
problems with your proposal. For one, it is a two-way system. If high
power is required at either end, it is required at both ends. Even with
a high gain antenna at the remote end, the gain works on both
transmitting and receiving.

For another, by using a single base station site to cover such a wide area, the base station receiver will be exposed to various noise sources over that entire area. The total interference from these sources will reduce data rates for all users' transmissions toward the base station.

Perhaps Geoff's MESH Network or Bruce's WiFi Network would be a good approach, but breaking the coverage area down into a more manageable size and using multiple sites.

Fred

Hi Tim. Well some more to consider!
However I am at a loss to explain it through any final Tank circuit or

switch problems. I have had the final assembly all apart twice now and gone through every component. Fotunately I have a reasonably accurate digital LCR bridge to even check the inductor values. All sems fine.
The antenna T/R relay was another suspect, but this too checks out OK.

The big "Tube" thing of course is that my 2 examples of 6883B's give such a difference in efficiency. one giving 25 watts out for 84 watts in and the other 25 watts out for 62 watts. Neither of these tubes are new or of known provenance, though they both are alledgedly OK on my Heath TC-3 valve tester. This is with one final operating in Kenwood's "novice mode". I probably didn't make this clear in my recent posting.
Since the final heaters are now in parallel I can very readily run this mode whenever I want too.
The fact that they are both inefficient, but to widely different degrees keeps bringing me back to the tubes being the problem.

Based on my experience with AB1 linears that I've built over the years I'd expect an output of ~55 to 60 watts with a ~90 watt DC input.
My old parallel TT21 (KT88 with tc Anode) linear was 67% efficient on 14 MHz measured with state of the art test gear in the mid 1970's.
Now from QST and other sources I know that the losses in the Pi network on the 820S are greater than those I obtained in my "home brew" finals, but even so I would expect ~60% efficiency if all is well.

I have tried bias changes BTW and the odd thing is that the plate current tends to rise after a short interval. This brings to my mind the possibilty of some kind of secondary emission in the 6883B's as the electrodes heat up. But so far the mystery remains.

In any event I hope to come home at lunchtime this Saturday with a collection of either 6146B's or 6883B's (or both) and finally prove the point! I will post a message as soon as I have more data.
73's Cliff Wright ZL1BDA ex G3NIA.

Hey folks,

A lurking SWL listener here. Was wondering something about receivers in general. Why is it that all-band receivers are generally more expensive than HF-only receivers? I know there are other circuits in there, but in essence, aren't all receiver circuits basically the same, just with the ability to tune to different frequencies?

I suppose another way of asking is this: a simple AM radio tank circuit could be modified by adjusting the coil turns and/or variable capacitor in order to pick up other frequencies. Why does this (rather oversimplified) simple change cause the cost of the receiver to go up nearly 50% in cost? (comparing a simple handheld AM radio with one that includes a shortwave band or two).   An AM/FM stereo radio is cheaper in many cases than a similar radio with SW bands. But you'd think that VHF reception would be slightly more expensive to manufacture than AM's nearby neighbor SW. Confuses me.

I also notice that HF transceivers can cost roughly the same as HF receivers - you'd think a receiver WITH transmitter would be much more expensive, but from what I can see its not. Something isn't registering in my mind as to why all these cost differences.

Thanks for your responses.

Yes, but I think you underestimate the importance of front ends, preselectors before the front end, and the variety of modes and filters to be demodulated with associated different bandwidths, and multiple IF stages in reducing intermod and reducing images.

The FM broadcast (88MHz-108MHz) band spans way way less than an octave, and is nowhere near the IF frequency.

The SW bands (1.6MHz - 30 MHz inclusive) span more than 4 octaves and usually overlap the best choice in IF frequency for filtering the most popular modes.

Get to "all band" (which I think by your definition goes up to the GHz) and you get like 8 more octaves for your front end to cover.

Many really substantial parts of a transceiver - other than the finals - are shared between the transmitter and receiver on low end models. Frequency synthesis, sideband filtering, etc. I think all low-end models share the receiver preselection with the transmit final filtering. And if you're comparing a very low-end transceiver (say $600) with an entry-level communications receiver in the same price range (say the ICOM R75) you will note that the entry-level communications receiver has many features not at all present on the transceiver. Hams like me might might gloss over a lot of those features because they aren't awfully relevant to ham band CW and SSB operation but they must be important to somebody, otherwise they wouldn't sell the radios, I guess!

I will note that the vast majority of SWL'ers seem to use radios definitely below the entry-level communcations receiver level and are typically in the under-$200 range.

For the past couple decades most ham transceivers were, out of the box, of marginal utility for SWLing because the filters were chosen for CW and SSB operation, not for AM. Yeah, they had a mode button on the front marked "AM" in some cases but didn't have a really good filter for AM installed from the factory. And all the preselection was optimized for the ham bands, not the SWL bands (assuming that you could tune outside the ham bands at all, not all could, but post-WARC many began being general-coverage for receive.) On the high-end ham transceivers I think this distinction is not really there anymore but we're talking about the > $2500 price range and the good high-end transceivers are beginning to incoprorate *multiple* HF receivers into them.

Tim.

Thanks for the responces, the proposal as rightly said is no different
from Wireless networks deployed by ISP in small communities. All I
need is pointers to hardware that can be used to archive this winthin
legal limits. The WiFi Solution seems to me more resonable as braking
the area into chucks means that some sites would be dependent on
others

Well, there are a few issues here.

First of all, most decent radios are superhets. This means that there must be an intermediate frequency. Selecting an intermediate frequency, or two, gets to be more of a problem the more frequencies you need to cover. Many DC to daylight rigs are full coverage, which makes the problem a lot harder than a ham band only radio, and adding more coverage obviously complicates the problem.

Secondly, as you go up in frequency, the problem changes. Component layout gets to be a bigger deal, and it is harder to get the gain you need. Many HF only radios have only marginal performance at 10 meters. If you are going to cover frequencies higher than 30 MHz, then you can't really fudge the 10 meter performance because you need to go beyond it.

At 50 MHz, you are sort of in a no man's land. You can use HF techniques or VHF techniques, but go firmly into VHF and you essentially are building another radio for the frequencies above 50 MHz or so. The techniques and parts are a lot different, even the problem you need to solve is different. At HF, it is easy to get more gain than you can actually use. As you go up in frequency, you need more gain but it gets harder to come by. Worse still, at HF the relatively low gain requirement is caused by noise in the atmosphere. Increase the gain and you get more noise, so it really doesn't buy you anything. That atmsopheric noise becomes less of an issue as you go up in frequency, but the noise in your circuitry becomes greater. As you get to VHF and beyond, you are concerned with noise figure, something that really doesn't matter at HF because it is orders of magnitude below the atmospheric noise.

As far as transceivers vs. receivers, well, there is a little cost differential, but perhaps not as much as you would expect. Part of that is because a lot of the transmitter circuitry is shared with the receiver. In particular, the expensive, critical parts are shared. The other dimension is that there is only a tiny market for high-end receivers. There are lots of SWLs out there, but very few SWLs who are willing to spend on a high end receiver. On the other hand, hams need a lot out of a receiver for it to be even useable, and they are more likely to buy a transceiver than a separate transmitter and receiver, so the size of the market starts to come into play.

Hope this sheds some light

..

Don't forget economy of scale.

I suspect many more HF-only compared to all-band receivers are sold.

AM or AM/FM radios are sold by the gazillions; undoubtedly many, many
more than are sold with a SW band. Don't know where you are from,
but just think of the ubiquitous AA5 (All American 5-tube AM radio)!

Well, there's cost, and then there's price. They aren't the same thing.

The cost may go up because:

- The general-coverage receiver may need additional "preselector" stages in its RF front end (one per band), and

- The differences in the local oscillator stage may be more involved than you think, in order to get an LO which tunes reliably, smoothly, and stably over a very wide range of frequencies, and

- The general-coverage receiver may need more sensitivity, as well as a higher IP3 (i.e. ability to handle strong signals without overloading) because it has to handle both local signals (which are usually quite strong) as well as weak DX signals that are down near the band's noise floor, and

- The general-coverage receiver may require multiple IF frequencies, switching between them on a band-to-band basis, in order to ensure that the IF, and the harmonics of the local-oscillator frequency don't wipe out the signal you're trying to receive.

Then, there's price. Price is as much a marketing and perception issue as it is a cost issue. The market for general-coverage radios is smaller, there are fewer models made, there's less competition between sellers, and the perceived value (the set of features or capabilities) is greater. All of these contribute to the supply-and-demand equation, and tend to cause the price to settle at a higher level.

>I also notice that HF transceivers can cost roughly the same as HF
>receivers - you'd think a receiver WITH transmitter would be much more
>expensive, but from what I can see its not. Something isn't
>registering in my mind as to why all these cost differences.

That's partly because the receiver actually does incorporate most of the signal-chain components present in the transmitter - power supply, local oscillator and tuning electronics and mechanicals, case, front panel, etc. - in many transceiver designs these are shared between the transmit and receive pathways. There's some savings when you eliminate the transmitter components, but less than you might imagine (especially in today's highly-integrated designs).

It's also likely that receivers sold as receivers, may have a somewhat more sophisticated receiver design (and better performance) than the receiver stages built into all-in-one transceivers, and thus may actually cost more to build.

Then, add the smaller-marketplace and this-is-a-special-purpose-box issues, and the market price floats up.

Good answers from everyone, thank you. In looking at the simplest of
tank circuits for radio, I just couldnt understand why you just cant
add more coil windings and different capacitance to increase frequency
coverage.....but it looks like its alot more complicated than that.
Thanks again.

In the old days, this is exactly how it was done, but even so, think of it this way............what had to be done was to use the same tuning capacitor, but switch different resonating inductors for each tuning range. The different tuning range inductors needed different ferrite mixes for the different frequency ranges. Then, there was the R&D.......I believe that much of this research data was taken from repeated experimantation. Even today, in my own experiences with RF simulation programs, we would still have to build and fine tune the circuit under development. Just to do a new synthesizer design from start to finish would take between 6 to 18 months (these are optimistic values). Figure an engineering team of at least 3 people that are being paid between 60k to 120k a year each, and it becomes a little bit clearer just how high engineering costs can be. This doesn't count the cost of multiple iterations of the design before the engineering review team deems things to be complete.

This is one of the reasons that I decided to homebrew many different receiver designs. This is a good way to learn "the hard way" many of the things that a manufacturer must go through when working through a design, from conception to final product.

Newer designs are a little bit easier now that upconversion topologies can be used. This type of design became practical, once VHF crystal filters became viable. The stumbling block with VHF crystal filters was that in order to work, the crystal elements had to be ground so thin that they became quite fragile. Enter the overtone mode crystal filter..........now, you could use a much thicker filter blank, and resonate this crystal element on one of its overtone modes.

What VHF crystal filters allowed one to do is use these filters at the 1st I.F. The significance here is twofold. First of all, single conversion receivers with a high I.F. and good selectivity could be designed. Second, in a multiple conversion design, these same crystal filters, because of their selectivity, are able to have good 2nd image rejection (2 X 2nd I.F.)

If you look at the specifications of todays roofing filters (the filters that follow the 1st mixer in a receiver), you will notice that a 910kHz rejection spec is given. The reason for this is because the 1st I.F. is always at some high frequency between 40 and 120MHz, while the 2nd I.F. is almost 450, 455, or 460kHz (image response would be at 900, 910, or 920kHz respectively).

After this is all done, the intermediate frequencies (I.F.) have to be chosen very carefully, with spur chart analysis of the various mixers for inband spurs (this had already been done by many manufacturers, so this step can be pretty much considered done).

To make a long story short, upconversion eliminates the need for multiple bandswitched coils in the LO section of a radio, because with a high I.F. a synthesizer can be designed that will operate over less than a 1 octave range.

The significance here is that you can now operate the Varactor diodes in the VCO portion of the synthesizer over the most linear part of their range. This allows you to have a VCO that has a K/V characteristic of less than 2:1 over its tuning range. When designing a loop filter for a synthesizer, the K/V characteristic is one component of the design equations. This is very important, so that the settling time of the synthesizer will be relatively constant over its entire tuning range. With synthesizers designed for frequency hop communications or digital modes, bandswitched Varactor diodes are sometimes used for a small portion of the tuning range. Other times, a dual mode loop filter is used, with a wide bandwidth loop filter used while the PLL is acquiring lock, switching to a narrow bandwidth loop filter once the system acquires lock. This improves the close-in phase noise of the synthesizer, thus minimizing reciprocal mixing effects.

Today, settling time is not as much a factor as it used to be, since the advent of Fraction N synthesizers. This design opens another can of worms, since you now have to deal with different types of spurs. One approach that has been used is what is called a Modulated Fractional Divider. This type of design translated the Fractional N mixing spurs further out from the LO carrier. This way, these spurs can be more easily filtered.

As an example, consider a radio with a 1st I.F. of 70MHz. To tune from 0 to 30MHz with high-side injection from the 1st LO, the tuning range of this LO will tune from 70 to 100MHz. The lower sideband range from the 1st mixer will be used in this case for receiving. The only tuned circuits required for good image rejection will be a low pass filter that cuts off at about 35MHz.

Since your image band will be 140MHz away (140 to 170MHz), this response will be far down on the low pass filter's skirts, as long as this filter provides good out of band attenuation. Good shielding is important here.

Mind you, this only covers the LO portion of the receiver. In order to have good strong signal handling performance, a good 1st mixer with good IMD performance is required. Suboctave input bandpass filtering also improves IMD performance of the receiver, because by limiting the aperture of how much spectrum space the 1st mixer is actually seeing, you are limiting the integrated power that is being applied to this mixer.

I could go on and on, but I don't want to hog too much bandwidth. I have touched on only a very small part of the design challenges that a receiver designer faces. I haven't covered roofing filter bandwidth options (the other limiting factor besides phase noise performance that limits what is sometimes referred to as dynamic selectivity). The 2nd mixer is where much of this limitation occurs.

Oh, then there is the AGC system design. Typically, a receiver with AGC applied only to the I.F. system will overload at around 3000 to 10000uV. To extend the dynamic range of the AGC system, AGC needs to be applied the the RF / 1st mixer stages so that it takes over at a level where the I.F. AGC "runs out of steam". If you are not careful when you design this part of the receiver, the two AGC systems can oscillate. Drake '7 Line owners...........think about how critical that AGC adjustment is on your units. If it is not set according to Drake's specifications, the AGC will oscillate when in the fast mode.

I hope this small bit of "scratching the surface" helps. I still haven't even covered the demodulator design and the audio stage design. And then, there are the challenges of designing a low noise power supply!

Thanks to all of the other posters, for all of your good information!

Pete

That works over a limited range. It can be pressed into service to cover 3.5MHz - 30MHz, which is (not too surprising) the range of bands traditionally covered by a ham-band transceiver. Going down to 1.8MHz or up to 54 MHz is possible with some cleverness and a number of recent radios cover those bands too.

All that said, using traditional techniques to do the bandswitching from the front panel involved a bandswitch shaft running through the length of the radio coupled to multiple switch wafers for each section that required switching components for different bands. Some even have multiple shafts for the bandswitching run by chains or gears.

Since this is the "homebrew" group, I should point out that some homebrewers with mechanical cleverness have done this sort of bandswitching in the homebrew receivers, transmitters, and (egads!) transceivers. But a more popular technique going back at least half a century is to build a base radio that works in one band (which may not even be a ham band) and use converters/transverters to use that radio in the band of interest. Some call this the "tunable IF" technique and in ham bands the tunable IF typically covers a span of 50,100,150 kHz (if CW or SSB sub-bands only) or 500kHz (if intended to cover a whole band). There are gotchas related to images/leakthrough based on choice of IF, too, but these have been overcome with few compromises with several popular choices. The result is usually not a DC-to-daylight radio but one that works on the desired ham bands; this is counter to what a SWL'er typically expects out of their radio. (It seems that most today expect to key in a frequency on the front panel and go right to it). So the "first IF at 45 MHz" approach is more popular there.

Tim.

I think you are zeroing-in on a plan that will work.  My point is that a
20Km radius is NOT a small community.  While the VSAT link may have
sufficient bandwidth, your wireless distribution system may not.

It would help reduce the load by using a higher bandwidth method such as
fiber, to interconnect the various local wireless base stations to the
VSAT terminal, rather than using the wireless systems themselves for
inter-site distribution.

Remember that a wireless system's bandwidth is divided among all the
users.  As more users access the network at any one time, the slower
will be the response.

One thing that I didn't see mentioned, was that many Short-wave Broadcast stations are using Synchronous AM transmission. I understand this is a form of double sideband with reduced carrier. It can be tuned by a Single Sideband receiver, but it is difficult to tune music so it sounds right. It sounds somewhat distorted on an AM radio.

For SWL use, I would look for a Short-wave Receiver that had a true Synchronous AM detector in addition to the other modes. I don't think you will find that in many Ham Radio transceivers!

Http://www.theradiolist.com - a new website has launched! find and
listen to your favorite radios or promote your own radio.
You can add your radio free for now, the website is currently in a
testing period.
There are some cool features like a browser player, with the embed
code so you can take the player and put it anywhere (just like youtube
videos), free hosting of your .asx .pls .ram files, and much more.

http://theradiolist.com come and take a look

Well Folks, I got a collection of 6146B's, used unfortunately, and a
small number of S 2001's the original tubes supplied by Kenwood.
Now this is VERY interesting!
The 6146B's apparently have to be VERY closely matched or one tube draws
most of the current. However the S2001's, which seem to have a slightly
lower gain, judging by the drive level required, were much more stable
and happily produced almost 100 watts output on CW without noticeable
distress! This was despite their characteristics being about 10% different.
In my research I had come across those who had had similar experiences
with paralleled 6146B's. Now it occurs to me that the cathodes of both

finals are directly strapped together with a small resistance to ground.
In the case of mismatched tubes perhaps this could be a source of problems.
However at least it is going quite well now. The mystery is still not
quite solved, but as time permits I'll go into it further.
Regards Cliff Wright ZL1BDA ex G3NIA.

```

I have a somewhat-odd request:

I am looking for color-matched knobs, banana jacks, binding-posts,
banana plugs, etc. Matching colored wires would be really cool too.

Having at least eight distinct colors available would be really nice.
I know that last one is difficult because I'm a very typical male who
cannot name more than four different colors off the top of his head.
But I have no problem looking at any color-coded resistor and having
the value and tolerance immediately register in big shining numbers in
my brain, so I don't think the problem is my eyes, I think it's just
that I'm male :-).

I believe that HH Smith etc. used to do stuff like this and while they're still around I don't see any colors but red and black in their catalog.

Looking in the Digikey catalog they list "Emerson"/"Johnson" as the maker of some banana plugs and jacks available in ten colors. If I could get matching colored knobs and maybe even test lead wire, I would be so so happy.

Any leads (including just "how to paint random knobs in matching colors") would be greatly appreciated.

In case nobody else has figured it out yet, this is for a super-duper bench tube tester that currently is just a bunch of stuff scattered across my bench but which in my head I could turn into one mega-super tube tester/curve tracer. Black would of course be ground, and I suppose the two filaments should be green, and maybe the cathode can be black, but I still need three other colors (plate, grid, screen) and at the moment can only name two, so seeing a catalog page with a color-coded lineup of everything would so make my vision come true!
Many decades ago I saw a picture in a magazine of what to my juvenile eyes looked like what must be the ultimate tube tester of all time, and while I do not remember the model or make I do clearly remember row after row of gleaming colored knobs and jacks. Does this description ring a bell with anyone?

Tim.

I believe Kilo sells anodized knobs in a few different colors, still, and
that Pomona Electronics should have a few colors of banana jack.

>Any leads (including just "how to paint random knobs in matching

Go to the auto parts store and get cans of automotive lacquer. It gives
a nice even finish on generic aluminum knobs and comes in more colors
than you can imagine.

Filaments are brown. Red is plate. Grid and screen are orange and
yellow but I forget which is which. There's a RETMA standard for all
this stuff somewhere.

AES, http://www.tubesandmore.com/, has knobs in 8 colors. Click on "Knobs" in the left hand column. In the next screen click on "Chicken Head".

I've never seen test lead wire in more than 4 colors. If you can use ordinary wire, colors shouldn't be a problem.

I have seen test wire in more than 4 colors. It is actually in the Belden catalog I have -- BUT the minimum order (in feet/spool) for any color other than red or black is high (at least 1000 feet, as I remember)

It does look cool when properly set-up. Old EF Johnson and HH Smith banana jacks did have several colors. Needs any in blue? I have several panel mount banana jacks in that color.

Not really (the one at the local Radio Shack (way in the back in 1970-something when I was getting an old Hallicrafters up and running) was more boring - blue and white with brown sockets and black knobs, as I recall), but I suspect that certain auction sites probably have exactly the thing you were looking at available from time to time. All the other old junque shows up there.

Not to deny you the joy of building, or anything like that - but if it was made, there are probably examples out ion the wild to buy, if you look for them.

In fact, following the lead of Alan Douglas, I think in my head the unit I had seen in a picture was the Weston CA-1630. Nice pic here:

http://www.tubedepot.com/tt-ca-1630.html

At circa $5000 I think I'll have to pass, but it's a beaut.

I think in my mind I want even more color matching than in the original - I just see black and red binding posts there, in my head the posts should match the knob should match the element. So it looks like the decades have elaborated the original, to the point where I desire something more than the original :-).

Like Scott Dorsey suggested, probably the way for me to go is to get 5 or 6 or 7 different color banana jacks and paint the knobs to match, as it seems increasingly unlikely I'll get much match in "raw" knob color, but still thanks to the others who posted about the multi-color chickenheads available from AES (I had actually bought them in the past!) and the knobs from Small Bear.

Tim.

Pomona Electronics plugs!  Nine colors available!  Stocked by Allied!

Strange!

Have you guys now taken up knitting and crocheting?

Hmmm.  I liked it better when you actually discussed electronic circuits!

> and all that good stuff?

Google "Grover Inductance Calculations" and you'll get loads of refs and comments on Dr. Grover's book on the subject (as well as places to buy it). Are you sure you really want to know THAT much about them?? :-) If your library has the book or can get it, it's an interesting one to have a look into. For coils (or for that matter straight wires) at RF, you need to start considering things like skin effect (where the current flows mainly at the surface of conductors) and proximity effect (where the fields from a nearby wire affect where current flows in the wire under consideration -- like how adjacent turns of a coil affect one another).

A more reasonable place to start might be a text for a first college course in electricity and magnetism. You'll learn enough about inductance to have a very decent understanding of it, and if you explore other topics there, you'll have the tools to understand a lot more about RF circuits and fields in general.

Finally, nothing replaces actually doing things with coils (and other parts), getting them to perform some function you want. I've done quite a bit of work with coils over the years, and I'm still learning. Last week, I spent some time working on a filter that uses several coils of approximately 100 nanohenries each. I'm looking for 100dB and more out-of-band attenuation. I had to get very detailed in my computer model to have it correspond reasonably well with measured performance, including the "parasitic" effects of stray inductance and capacitance--more so than I initially expected. In a lot of other situations I deal with, those strays aren't nearly so important. That's the sort of thing you'll probably learn better by "doing" than by "reading."

Cheers,
Tom

So you claim it doesn't work because one diode will "hog" the current?
Well, that's the point! D1 "hogs" the current and establishes a fixed
voltage for the base of TR1!!! But alas, it only works if your ground
plane is 9 square feet.......

So where's that schematic, Brian?

Have a quantity of  Test Equipment and Radio Communications Service Manuals,
both Commercial & Amateur
Most of them are in Like New Condition.
Prices are reasonable...mailing may more than the manuals..depending where
you live!

Please check my site:   www.rodemi.com    for what is available.
Click on the  MANUALS  Heading.
I am updating the site as time allows.
> Just added a MAXON List...more to come <
I recently retired from the Commercial 2-way radio business and would like
these useful manuals to find a good home.

Thanks for looking....Norm VE3CZI

I was just wondering if anyone has one, or knows of anyone using a
Kenwood TKR-750 Type K2 Repeater with a Cat 400 Controller.

> Frank   GM0CSZ / KN6WH

Hi Frank!
You know some years ago I had a similar Yaesu rig. I actually replaced
the sweep valves with 6146B's because of just the problem you describe.
When it was converted I had to pull all but one plate off the
neutralising cap beacause the interelectrode capacity of the "real"
TX valves was so much lower!!! Sold it when I got my more "advanced"
Kenwood a few years back.
However the 820S only has an 800 volt secondary with a bridge rectifier
and about 100 uF of smoothing caps.
I have discovered that valve testers are quite useless for testing
powerful tubes like 6146's and larger. They simply don't have a high
enough supply voltage built in and valves that test Ok can be a bit
"soft" and flashover at once with 1KV on the Anode.
However I hope to get some more 6146B's or their 12 volt version
the 6883B at a junk sale coming up soon. If not I'll look out for
another TT21 and modify the final box to take it.
At least then I'll be loafing along with 90 watts anode dissapation.
I have a "soft spot for the TT21 as I used a single one back in the 70's
to get DXCC and WAC. That worked with 1KV on the anode fine for years
and was dead stable!

One last point about Jap transceivers. They never seem to monitor grid
current. My home brew final did, and it was by far the best way to be
sure that your final was working properly in class AB1. In the 820s
there is even a spare switch wafer so I'm thinking of installing it
using the existing meter!
Regards
Cliff Wright ZL1BDA ex G3NIA.

As usual Frank you are missing the important point here. That point being that you can't simply parallel two diodes... and have them share currents. This would have to be done in order for any tracking between the two. The problem is that one diode will always turn on before the other... and take all current. Now I ask you... where is the sharing/ tracking in that scenario? The answer is: there is no sharing/ tracking... because one diode with the lowest drop will hog the entire current... and the other diode will be off. this is why the gentleman on the web page link that YOU provided says it that scheme works like crap. He's absolutely right!

Amazing. Two major bungles within one month. First you couldn't
```

recognize a simple voltage multiplier, and now you show that you can't even understand the basic principle of diode biasing of a transistor.

Frank, again you resort to degrading statements in an attempt to shift
the focus and avoid the topic.
You have suceeded... end of conversation with you.

This may not seem like a "homebrew" question, but it is!

I have a Kenwood 440SAT which is failing, but the AT (Antenna Tuner)
is still working. Since the 440SAT can (could) also be purchased as a
440S (i.e., without the AT), the AT may be a stand-alone "module", and
I'd like to remove it and package it separately to use with a new radio.

I also own a nice crossed-needle VSWR meter, so I don't have to depend
on the one in the 440.

Any suggestions?

|As usual Frank you are missing the important point here. That point
|being that you can't simply parallel two diodes... and have them share
|currents. This would have to be done in order for any tracking between
|the two. The problem is that one diode will always turn on before the
|other... and take all current. Now I ask you... where is the sharing/
|tracking in that scenario? The answer is: there is no sharing/

|tracking... because one diode with the lowest drop will hog the entire
|current... and the other diode will be off. this is why the gentleman
|on the web page link that YOU provided says it that scheme works like
|crap. He's absolutely right!
|www.telstar-electronics.com
|
|-------------

Bovine excrement. Ever heard of equalizing of current through a series resistance? Often called a ballast resistor. Used quite often in power transistors where there are several base/emiter pn jumctions.

james

No Brian

He is quite on topic. You are failing to comprehend a very simple
basic understanding of the biasing of a transistor.

The topic is the concept of using a diode to bias a transistor, a
concept understood by any first-year electronics student.

But not you.

The BE junction stays at or above quiescient current BECAUSE the diode
is hogging the current. It even says that in the article (that you
obviously didn't understand).

Two diodes..... sheesh..... I'll bet you've never seen a Vbe curve,
either.

>You have suceeded... end of conversation with you.

Well, since that's the closest thing to an admission of ignorance that
you are capable of, I'll take all nine square feet...... ROTFLMMFAO!!!

OK James... less not discuss ballasting... because that has no bearing
in this particular discussion. Maybe you can tell us how the diode
method of biasing shown at http://www.ifwtech.co.uk/g3sek/tr-bias/tr-bias1.htm
(bad circuits section) works. And since you think that circuit works
well. Please tell us why.

To which I should have added:
Taking the tuner out of the radio and making it work as a stand-alone
tuner might be interesting but more likely a huge effort. You should
first get the manuals and schematics for the radio and the stand alone
Kenwood tuner and see what ends up where between the built-in and
stand-alone versions. If you can fix the radio then you have a radio
with a built-in tuner. If you sell the radio as-is you might have
enough to buy a new auto-tuner like an LDG,
http://www.ldgelectronics.com/ If you actually can remove the tuner and
make it work as a stand-alone version you should write an article about it.

I don't see why it would be a big deal to remove the auto-tuner from the 440SAT. I have the 690S(AT) which is just a 450S with 6M built in. The manual for the radio has a 9 step instruction for INSTALLING the auto-tuner. Start at step 9 and work backwards to UN-install the tuner. The 450 is basically an updated 440.

I expect it should be relatively easy to remove the tuner, *BUT*, OP wanted
to use the tuner after it was removed. Most modern radios have fairly
elaborate microcontrollers. An astute engineer would likely use the
existinc CPU for the autotuner, rather than adding another, unless the tuner
option were an afterthought.

Even if the tuner had a dedicated processor, the controls from the tuner
almost certainly come from the rig's main processor. I suspect it might be

fairly tricky figuring out how to talk to it, even if OP is a
microcontroller guru. In any case, he is likely looking at a significant
micro project to make it work.

Hi all

Is there anyone in the group who has a 1980 ARRL handbook who could
scan and email me the circuit of the xtal calibrator/marker generator.
I've a friend building replica glowbug regen receivers who needs this
info to help get his unit operational.

Thanks miken,   zl1bnb

You'd do well to give an idea of what's inside.

The Handbook changes glacially, so chances are good any specific
article is in more than one edition.

Hello Miken:

I found my 1981 ARRL Handbook. They have a "marker" generator, which uses an LF-353, a 4001 and a 4013 - all integrated circuits. There is also a simple 2 transistor 100 kHz oscillator.

The marker generator puts out 100, 50 and 25 kHz.

When I read the request for a circuit to supplement a glowbug, I thought a tube crystal calibrator would be what was wanted, and thought perhaps the later 1981 edition might have abandoned a tube version. So, I pulled out a 1972 ARRL Handbook and even then all they had was solid state.

If you are going to use integrated circuits in a glowbug receiver, you need to hide them, since it is unbecoming and might cause others to ridicule the otherwise heroic effort to recreate a glorious radio. A simple tube can do a wonderful job of putting out 100 kHz signals, and if you want 50 kHz, you can use a neon bulb divider.

Many of the simple receivers I built would have been lost with a 100 kHz marker. A 1 MHz marker would have been more useful, and even then I was guessing at the which MHz it was. The best marker was simply a crystal in the ham band and a known point. Something like 3550 kHz, which could also be used to spot at 7100 kHz. Even odd marked frequencies are useful - then a properly hand calibrated graph laminated on the front panel (ala HRO) will give a feeling that none of the wonderful new rigs can touch.

Colin

do you have a link for using a neon lamp as a frequency divider? This is
the first reference I've seen for this, and I'm fascinated to learn more
about it.

Peter

Hi Peter:

That will teach me tomake a statement without my resources handy, so please do not time me. I have started looking now. I recall that there are probably one or more in Hints and Kinks, none in the ARRL Handbook (it was pretty basic as far as test equipment0, one or more in QSTs from the 50s and various other books. I have most of those so will go through them. We have a lot of readers, so do not be bashful if you know the references.

Some of the early computers used neon bulbs as dividers and the circuit is in some of those textbooks.

Well, go ahead and time me starting - - now.

Colin K7FM

When I saw Colin start to suggest a tube calibrator, my thought was
"what will you use for a divider, a neon bulb?"

But like him, I can't put my fingers on a circuit. Undoubtedly
somewhere someone did build a crystal calibrator with a neon divider
to get closer together markers, before there were IC dividers.

Another common place would be electronic organs, they'd use neon
bulb dividers to get the next lower octave from a master oscillator.

I'm sure in those "101 things to do with Neon Bulb" books, or even
the wide coverage articles in the magazines, would have a divider.

One Rufus P. Turner book I do have from the tube era has no such
dividers.

I can't find the one book about electronic musical instruments that has
a lot of organ circuitry, which likely does have dividers.

Tube era frequency counters likely used them to some extent.

I am blank about how they worked. It may be like a synchronized
oscillator, using the crystal oscillator to sync a free running
neon bulb multivibrator.

There were also pulse counters, collect pulses until they voltage
of the collected pulses trigger something and it starts over again.

I'm sure I've seen the basic principle, whatever it is, used with
unijunction transistors and even 555s, they all operate basically
the same. But I sure can't find an exact reference in the books
I have handy.

Hi Michael:

I know I have seen at least a few circuits, but so far I have not put my
eyeballs on one. I checked QST back to 1950, being distracted a bit when I
came upon the Clipperton Island DXpedition. Also checked a number of Hints
and Kinks.

Even used Google. I found a number of references to them, but no actual circuit. Although they were used in electronic organs, I know I have seen crystal calibrator circuits using them.

Shhhhh. Please do not let my wife know that, with bookcases spread out all over I cannot find the circuit. Her idea is that if I have not looked at something in the last 15 minutes, I should discard it - even though she still keeps her old clothes she does not fit into anymore.

And, remember that the neon bulb also makes a nice low current screen regulator, too. (oh, oh, now someone will ask for that circuit.)

Back to the library,

Colin K7FM

In the process of looking for the neon bulb divider, I found a few circuits using a ECC81, or a 12AU7 or a 6U8 divider - and one circuit even using a simple rc oscillator locked by the 100 kHz crystal to yield 50 kHz signals. That was in QST.

Neon bulb bistable multivibrators were staples of low speed digital counters and of course electronic organs; the circuit relies on hysteresis of twin bulbs connected through a common (cathode) resistor. I may post links to some example implementation diagrams.

> There were also pulse counters, collect pulses until they voltage
> of the collected pulses trigger something and it starts over again.

One can use a charge pump (diode pump) to accumulate (constant width and amplitude) pulses until neon bulb breakdown potential is reached and the bulb discharges the output capacitor restarting the cycle.

Regards,

Michael

>How is the 440SAT failing? Any chance of repairing it or selling it as-is?

Ignoring the "bouncy" buttons, everything works fine on CW but won't
modulate. Microphone may have failed, and I haven't gotten around
to cobbling a substitute to the right connector.

FWIW, I realized today that I DO have full manuals and have learned that,
even though the AT can be an after-market addition, the schematics show
the AT is controlled by the radio's processor and making it work without
the radio will be a real pain!

>info to help get his unit operational.

Maybe the following will be of help:

QST page:
* 12, May '37:  "A 100-Kc. E.C. Oscillator for Frequency Checking"
                 uses a 24A tube
* 53, May '37:  "100-kc. Calibrating Oscillator" uses a 6L6 tube
* 40, Jan '39:   1000 Kc calibrator uses 6F6 tube
* 34, Sep '41:   50-, 100-, and 1000-kc oscillator uses three switched
                 LC combinations and one 117L7GT tube
* 52, May '45:  "Battery-powered one-tube 450- and 1500-kc. signal
                 generator" (1G4, 1H5, or 30 tube)
* 31, Oct '51:   Uses both halves of a 6SN7 dual triode to produce
                 50-kc signals
* 68, May '52:  "Simple crystal marker oscillator" uses a 6J5 tube
                 plus two resistors and 'most any crystal.
>>>>> This is the SIMPLIST calibrator circuit I've seen! <<<<<
* 41, Jun '52:  "...Frequency Standard...Oscillator" uses a 6F6
                 oscillator, both halves of a 6SN7 as a multivibrator,
                 and a 6K8 buffer/mixer to give 100-kc and 10-kc points
* 43, Sep '52:  "Fig. 2 - Oscillator circuit for a simple 100-kc crystal
                 standard" uses a 6AU6 tube and NO inductor!
* 40, Jul '54:   Uses a 6AK5 to produce 100/50-kc harmonics
* 14, Mar '55:  "Frequency Marker with 50-Kc. Intervals" uses a 6AK5
                 and both "halves" of a 6U8 to provide harmonics up
                 to 30 Mc.
* 61, Jul '59:  "100-kc calibrator with 1-kc markers" uses a 6AU6
                 oscillator and an NE-2 sub-harmonic generator
* 30, Mar '62:   Uses a 6AU6 oscillator at 100 kc and a 12AU7
                 multivibrator to also give 50 kc markers
* 33, Jan '65:   Uses a 6AQ5 oscillator at 100 kc and a 6AS6 10-kc
                 sub-harmonic generator (no diode and NO inductors!)
* 34, May '65:   Uses a 6AU6 oscillator at 100 kc, a 12AU7 multi-
                 vibrator for 10 kc points, and another 12AU7
>>>>> ACCURACY:  multivibrator for 1 kc points!

CQ page:
```

* 35, Jul '47: "A Simple Frequency Standard" uses both halves of a 6SN7
          and one semiconductor diode (an easily-hidden 1N34) to
          produce 1000- and 100-kc signals up to about 60 mc.
* ??, Apr '55: "500-kc Marker" uses a 6AU6 tube
* 29, Dec '55: "A Heterodyne Crystal Calibrator AND CODE PRACTICE
                 OSCILLATOR" uses both halves of a 7N7, 6SN7, or 12AU7
                 (or pairs of many triodes) and two crystals to give
                 marker signals at the DIFFERENCE of the two crystals

RADIO-ELECTRONICS page:
* 34, Oct '55: "Dual-Frequency Crystal Calibrator" uses a dual-
                 frequency crystal and a 6AK5 to produce outputs at
                 1000- and 100-kc. Adds a 1N34 diode and a 6BE6 tube
                 to make a harmonic generator. Adds an NE-51 as a
                 relaxation oscillator to make the marker points
                 more-easily recognized!
* 52, Sep '66: "Crystal Calibrator" for CB; uses a 6C4 oscillator

If those aren't enough, I can also cite several "utility oscillators"
(which are usually coil-less).

Oh...I didn't get what the original poster wanted to do...I thought he wanted to use the radio without the tuner. So...yes, it might not be the easiest thing to do (get the tuner working as a stand-alone unit). Taking a quick look at the schematic for the auto-tuner in my 690, it appears most of the brains are in the tuner itself. Unfortunately, there are several signal inputs that are labeled cryptically, so it might be a bit difficult to figure out what they are used for...

Actually, maybe not as much of a pain as if the thing had its own processor. If the AT had a dedicated processor, there would certainly be some control lines from the rig's processor. Reverse engineering what those control lines did could be a real problem.

But if the AT is controlled by the rig's processor, then there are interface lines to the things that need to be twiddled, and it should be fairly obvious from the schematic what twiddles what. So the problem simply becomes writing autotuner software, which isn't all that bad. All the grody hardware work has been done for you! Ok, certainly not a trivial project, but I'm not sure it rises to the level of "a real pain"

Of course, some folks have a different comfort level with a soldering iron than with a keyboard, so I imagine there are some that might see it differently.

Myron, you get the research gold star. I see the 1959 QST article uses a neon bulb, although it was not the one I was thinking of. I think I quit in QST when I got to 1959 because I thought the transistors would eliminate the tube dividers. I was about to go through CQ, though, so you saved a lot of time there.

>I was thinking of....

That one used the NE-51? Another one used an NE-2.

>I was about to go through CQ, though, so you saved a lot of time there.

For the almost-50 years I've been a ham, my method of indexing articles
has been to TEAR & FILE. Most QST's, CQ's, HAM RADIO, RADIO ELECTRONICS,
RADIO & TELEVISION (in its many incarnations), 73's, and several other
electronic-related magazines, including many printed before I was born,
have passed through my ripping claws, so all I did was turn to the right
file (labeled "frequency standards", in this case) and start listing them.

I also have an almost-complete set of QST's dating back through 1936,
but quit saving the actual magazines in 1977 (78?) when they went to
the bigger format. I'm thought about buying the CD set, but, at my
age, the payback will not happen.

Unfortunately, I've spent more time tearing & filing than I have building,
and now, what with the Internet.... Someday I've just gotta get my
priorities right.

I would have stopped about then also, not so much that we'd see dividers
at that point, they were never a routine part of crystal calibrators
until logic ICs became readily available (you did see dividers before,
but they weren't common), but because transistors were starting to
come in. Transistors were ideal for such small projects, because they
didn't need filament power (or B+), and they weren't ready for power
or high frequency use.

The earliest Handbook I have is 1961, and I see a transistorized
crystal calibrator but no tube based one.

Yes! My plan is to use a dedicated low power regulator.

By the way, I have found a company in West Sussex called Lincoln Binns who do a range of extruded cases which are very competitively priced, delivery cost is reasonable. I spoke to them today and they are happy to deal with private customers and will supply one offs.
See http://www.lincolnbinns.com/products.htm

Charlie.

Try the BAMA boatanchor manual archive. I know at least the calibrator
schematic for the Heath HR-10 receiver is posted there.  It should be
easy to duplicate.

Hi Colin

Please don't go to any great effort on my part!  I didn't think about using
two neons in
a multivibrator!  I wonder what the maximum useable frequency would be, and
the
strength of the harmonics...

|OK James... less not discuss ballasting... because that has no bearing
|in this particular discussion. Maybe you can tell us how the diode
|method of biasing shown at http://www.ifwtech.co.uk/g3sek/tr-bias/tr-bias1.htm
|(bad circuits section) works. And since you think that circuit works
|well. Please tell us why.
|www.telstar-electronics.com
|------------

Actually quite simple if you understand nodal analysis. Per Kirchoff's Laws the total current leaving a node must equal the current entering a node. The particular node that is of interest is in bad circuit A, is the junction of VRI, D1 and the base of the transisitor. For DC analysis the cap is an open circuit and the RFC is essentially a short. The current through D1 is set by the value of VR1, the supply voltage and the internal pn junction of the diode. The voltage drop across D1 is determined by the current flowing through the diode. In turn this sets the Vbe voltage of the base/emmitter PN junction. The instantaineous base/emmiter current varies with RF drive level. Should this current exceed 1/10th the current through D1, then D1 starts to loose regulation. This is the basic workings of a shunt regulator. Any good first year tech should know this.

For either circuits, bad A and B, to work properly, the D1 diode current should be ten times the peak instantaineous base current of the RF power transistor. This type of biasing is good for low power RF

devices. When dealing with large power devices, ie in the 100W and
more class, this is not a good bias as the wasted heat in VR1 and D1
is very inefficient and prone to failure. Also there is no protection
should a voltage spike on the DC supply propogate through. Most
bipolar RF device do not like more than about 4 VDC base/emmiter
voltage. Both circuits have no provisions for limiting the bias
voltage in such a manner to cause permanent damage to the base/emitter
junction.

Charley, for that regulator, take a look at Charley Wenzels home page
http://www.techlib.com/electronics/finesse.html. You'll find the circuit
most useful in cleaning up that tuning Voltage by lots of dB. I don't build
an oscillator without it.

Would you let me know the price of that "ECS220" cabinet? And how are you
going to shrink the LCD display to fit it?

Regards
W4ZCB

The harmonics should easily go to 30 MHz.  Good measure of sensitivity as
the harmonics decrease as you go higher.  If one band drops greater in
proportion to the others, then that band could have a problem.

Hi,this is santhosh 7th sem BE.
   we actually decided to do a local positioning system as our final
year project.But we got some comments about our projects that
directiionfinding is not an easy thing.so can u suggest some ideas to
accomplish this.
```

There's a section in my GE "Glow Lamp Manual" on neon dividers.

```
                 sync in  -------------+
                                       |
        250 V ----/\/\/\---+---|*|-----+------|*|-----gnd
```

```
                  5.6M     |   n1             n2
                           |
                           +------|(-----+-------|(----gnd
                           |      c1     |       c2
                           |             +-------  output
                           |
                           |
                           +------|(-----+-------|(----gnd
                                  c3     |       c4
                                         +-------   sync output
```

C2 = 10 * C1 (For 200 Hz output, .005 and .05 uF)
C3 = C4 = 100 pF

The problem here is that neon bulb relaxation oscillators top out at, according to the charts in the book, at between 10 and 30 kilohertz, depending on bulb type.

Whoa, whoa. I know that tube ratings can be bent a little bit, and while there is a tap on the transformer for "800V" this is intended to be 750V to 800V after rectification, with load being drawn.

If you're measuring the voltage without load, you're right, it will be higher than the voltage with load.

You might check that you're using the right tap on the input of the transformer, too. IIRC there are 100V and 120V taps on the input.

> territory. Just a bit of SWR then Poof!!!

See, if you're transmitting then you draw current and there's no longer quite so HV there. 6146B's will stand up to a good amount of abuse, and usually other components in the final compartment will arc over and give up their smoke before the tubes.

> I'm now considering modifying the case and using a TT21 as a final.

Well, if you really want to, sure. But 6146B's served fine in these radios for decades. Yeah, Kenwood pushed some of the numbers past a strict reading of the tube limits but everyone pushed their 6146B's a little past ICAS. (Remember, those were the days when Swan claimed to get 600W out of a couple of sweep tubes.)

Tim.

Google for "doppler direction finding" and look for the ham radio
construction projects. Really simple ones exist which will give you a
bearing with two antennas (manual pointing) and slightly more
sophisticated ones provide a digital bearing from four antennas. You
will need an FM receiver for the detector.

Lots can go wrong in RF geolocation systems, because of things like reflections of the transmitted RF off other objects and trying to resolve two or more sources on the same frequency. Some ways to detect _direction_ include the already-mentioned Doppler systems, systems where you detect the phase of the RF received at multiple antenna elements (you gotta account for the mutual coupling of the elements...), systems where you observe the maximum response of a directional gain antenna (e.g. rotating a Yagi antenna), systems where you look for the direction of a null (e.g. a loop antenna, sometimes with a sense antenna to resolve the ambiguity of their "figure-8" pattern that has two nulls, rotated till the signal nulls), and systems that use the directionality of two or more antennas, using the ratio of their amplitude responses to find a line of bearing (like two loops at right angles, so you have two figure-8's at right angles; if one antenna is nulled, the direction is aligned with the other antenna's peak response; if you get equal amplitudes from both, the line of bearing is mid way between the two...a sense antenna can again resolve the ambiguity).

All of those give lines of bearing. To get geolocation, you need something more, like a triangulation system where two or more lines-of-bearing cross where the signal's coming from; or a system that measures the difference of time-of-arrival of the same signal at several different locations that are time-synchronized.

I'm sure you can find whole books on RF direction-finding and RF geolocation.

Cheers,
Tom

I was curious if there was a limit on the upper frequency, and I was wondering about the waveform as well; that is if the circuit can produce strong harmonics up into the upper HF regions. It would be an interesting project to build!

Pete

I want to add 160 meter capability to my HB link coupled antenna tuner.

Can I simply install an extra inductor to switch into the circuit for 160 & not worry about physical balance relative to the link

```
oooo OO oooo   = current arrangement

                       o
                       o
                       o = add in inductor for 160
                       o
                       o
```

```
oooo OO oooo_]  = switch          = proposed arrangement
```

Well Tim OM.
Don't worry, I checked the voltage both on and off load. Since I've been
a ham for 50 years+ and a professional electronics engineer (now
retired) I'm pretty familiar with PSU regulation problems.
BTW the secondary is labelled 800 volts both on the transformer and in
the service manual, so there is no possibilty of error there.
With 60 mA of anode current for the 2 finals the voltage is 970 and
when putting out 75 watts (CW) it is still 890. (using 3 different meters)

However as you say it was made in a time of wishful thinking!!!!
Looked up an old ARRL handbook from the 70's while searching for ideas
and found a 4 sweep tube final allegedly putting out nearly 1KW.
However call me an old conservative (engineering wise anyway) but I
still like a factor of safety.
I'm off to a local junk sale in a couple of weeks and if I can get some
more 6146B's (or 12 volt equivalent) then I'll stock up and flog them to
death! But if I can get another TT21 (KT88 with a top cap anode) then
I'll drop down the tube bases, enlarge the chassis hole and replace the
6146's altogether.
As you probably know the TT21 has a 45 watt dissapation rating and can
be run safely up to 1.2KV in class AB1.
Then I can get the rated output without "blowing a gasket".
BTW what I said about a grid current meter is VERY important!!!
Nothing tells you if a class AB1 final is working properly as well.
In actual fact a pair of 6146B's would be VERY hard pressed to deliver
more than 130 watts ouput, even with an optimally designed final tank
circuit in AB1. Very few transcievers have such a good Pi network on all
bands either!
In conclusion I should point out that I mostly work CW on 14MHz, with
the odd excursion into SSB.

Ok, finally found a single tube 100 kHz. crystal oscillator that uses a neon bulb relaxation oscillator that is synchronized to achieve 10 kHz signals. The article appears in the fifth edition of Amateur Radio Techniques, on page 287 and 288. It cites the original article from DL-QTC (August 1966).

The relaxations circuit is set up on the screen of the pentode oscillator, which is also used as the feedback source for the crystal. So, it is used apparently used as a synchronized 10 kHz source for the oscillator tube, which is then operated as a mixer. So, we do not need the neon bulb to operate at a high frequency.

Harold,

Thanks for that link to Charley Wenzil's site, it looks very useful.

The case I am going to use is the EDS220 not the ECS220. The ECS box is approx $20 and EDS is approx $36. Panels around $2.60 and bezels are approx $2.50 each. All prices(UK �) here: http://www.lincolnbinns.com/e_case_prices.htm . By the way , I ordered the case and was told that they would dispatch it today so I will let you know what the quality is like. I suspect that you can similar cases cheaper in the US.

The counter is a kit with an 8 digit display and programmable offsets so it can measure the VFO frequency. The kit costs almost as much as the BITX20A at approx $80! I had aimed to get this beastie in at under �100 ($200) but it's going to be around $250 in the end. You can see the counter at http://www.cumbriadesigns.co.uk/Minicounter.htm The display piggybacks on the counter board which is 43mm deep and will attach to the panel. Looking at the case drawing I have a couple of mm to play with!

I am planning to use a led bargraph to indicate signal strength, SWR & power, not accurate but useful indicators.

Charlie.

It would be a lot of work, for a somewhat mediocre result....and speaking from working on the ATU in several TS440, here goes...

The tuner band switching is done via the radios CPU - could be hard wired via a switch. But that sort of defeats the concept of an auto ATU - still, amateurs have done weirder things than that before...

The SWR/tuning sensing is inside the ATU, no probs there...it does feed back to the PA as a high SWR protector, how to use it would require some thinking...

BUT the thing has a fairly limited tuning range anyway - its small, has to fit inside the radio, so its ability to match to a wide range is not very good (cant remember the figures)

Why not just fix the radio? - they go fine, have very little commercial value so ideal mobile/backup radio - no great loss if its stolen out of a vehicle. The Kenwood manual is excellent, easy to read to fault find, and there is even a YAHOO group devoted to the beast...

73 de VK3BFA Andrew.

Not really so bizarre; there are stories of certain computers with light-sensitive neon bulbs in the logic that were affected by ceiling fluorescent lighting when panels were removed from the racks...

Regards,

Michael

The trigger point does shift with light or RF. Black paint on the lamp
will take care of the light.

In my "junk that should have been thrown away" I have a frequency
counter that I built from an artical in QST many years back that used
10 neons per digit. Many years after the fact I realized that it might
have been more practical if the Neon high voltage had been gated off
during the counting phase and on only to display the count. But then
it would not have looked nearly as impressive during operation.

There was a circuit where numerous NE2s were wired on the circumference of a circle as individual relaxation oscillators. At first, the firing pattern was
entirely random, but over time the lamps would synchronize and fire in order!
The light from an adjacent lamp would lower the firing point the one next to it.

Pete

The neon bulb was a wonderful device for a young boy to play with - and for those that do not entirely grow up. It energized at about 60 volts, although that varied from tube to tube. ARC-5 receivers used them across their input, to discharge static electricity. They were great for hams with meager funds since you could place one near the final and determine if there were parasitics, by the color of the glow.

Sensitivity could be increased by putting a dc voltage on the plates just under what it took to fire. Then, a slight amount of rf would add to that base and fire the bulb.

Little pocket testers would distinguish between ac or dc, by simply looling to see whether one or two plates were lighted.

Light wuld affect the sensitivity, as well as heat. You could apply a voltage just under the firing voltage, then put your finger near it and it would light.

Although I never built one, it probably would have made a great lightning indicator, with directional probes connected to indicate which quadrant the lightning was coming from.

As I recall, we used to salvage neon bulbs from old flouroscent light starters.

And, of course, they were good for neutralizing those old triode finals.

73, Colin K7FM

Well no, because there's no loop.

It wasn't uncommon to inject a bit of signal from one source to an
oscillator to synchronize them.

That's what was used in oscilliscopes that didn't have triggered
sweep.

I seem to recall that's what was used to synchronize TV set
vertical sweep to the incoming signal.

THere were lots of examples.

PLL's were too costly and complicated during the tube era for
common use, and any real referenfes to PLLs in the hobby magazines
didn't arrive till the late fifties.

Early seventies, and they were all over the place, because ICs
had made them a lot more practical. ANd I suppose there was
suddenly a need; after all, most of the early PLL synthesizers
described in the ham magazines were for 2M FM use, where crystal
control was used in virtually all rigs, but the cost was too
much when you wanted a lot of channels.

Sorry for being off-topic, but the heath/zenith NG seems to have died.
Does it help if I have an expired ham license? :-)

I have need of an RS-232 terminal, and I know that
my H89 (with no floppy--boat anchor!) contains one.

Can anyone point me to details for disconnecting the
H19 board from the CPU board and connecting it instead
to the DB-25 on the back?

(Even better, connecting it directly to a DB-9 which I'd have to buy)

I need it to configure a Sun Ultra, since I don't have a Sun monitor.

Thanks

The tank will prefer turns added symmetrically to each end for RF
balance...
Having said that I doubt that the Sun will stop shining if it is
mildly unbalanced to the link placement...
If it is added turns at 90 degrees to the present tank - like your
diagram - it won't work worth a hoot...

Now, having made those prognostications let me suspect that simply adding turns to the tank, symmetrically or not, is the least of your problems... You need more link inductance (double what you have on 80) and you need more capacity in your series cap on the link circuit (lots more!)

What is preventing you from using a PC (desktop or laptop) or a Mac running a terminal emulator as your console terminal for the Sun WS?

That would involve somewhat less work than converting the H89 and
you would have the benefit of emulating a terminal type appropriate
for the Sun serial console.

Regards,

Michael

```

I am adding more capacitance via a doorknob cap that will be switched into the circuit. My link is plenty big & has multiple taps & it is tuned.

I suspect you are correct re: the balance, at least that's what I have gleaned from an old QST article.

Hi Colin

Thats the one, you've confirmed the device line-up,a 4016was incorrectly in the place where a 4013 should have been, so it's no surprise the marker wasn't functioning correctly.

There's a separate band-edge marker using a 3.5 MHz xtal.

Many thanks de miken,   zl1bnb

That's a great list of projects.

I've suggested to ZL2CDH who builds the glow-bug rigs, that he makes a marker/generator using some of the hollow-state devices.

Thanks   MikeN,   zl1bnb

None of my Macs have RS-232 (though of course I can get a USB converter)
But I do have a Kubuntu box with RS-232 which I could hook up with a
crossover. However, if it didn't work, I wouldn't know whether to blame
the Sun or my emulator config.

Plus, without a floppy drive, the H89 is useless, so this gets
something out of it.

Sounds like you are on the right track...
We are currently building balanced link tuner #5 for 160... The
capacitors are 90% finished and Tim is mumbling to me about needing
some coils (my job)... We have 4 of them out in the field at the
moment on 80 and 160... They are motorized, remote control, and
capable of more power than the Henry 3K can generate...

GL - denny / k8do

> to the DB-25 on the back?

This is from vague, 27-year-old recollection.
There are two boards in the H89. One of the boards

is the computer, the other is a terminal. The terminal board is the one attached to the actual CRT, the computer is attached to the (100KB, hard-sectored) diskette drive.

The computer and terminal are attached with a single cable with perhaps 5-7 lines using standard RS-232 levels. You just need to pull that cable off, figure out the pinning on it, and make a replacement cable to connect to the DB-25. I can't remember well, and I advise proceeding with caution, but I very vaguely recall that maybe you could move the cable that connects the computer to the DB-25 to the terminal board, after removing the cable that connects the two boards together.

>
> I need it to configure a Sun Ultra, since I don't have a Sun monitor.

You've got some vintage hardware there ;-)

Indeed, using the terminal portion has merit, but why not also
add the missing floppy (I presume it is just the 5 1/4" drive
that you lack)? Look in dumpsters, curbside, surplus and
thrift stores for any old XT-clone to rescue a full-height
floppy ;)

The book is pretty vague on the speed of a discharge. Neon lamps
are sloppy parts. They age, their characteristics vary by how much
illumination they get from other lights (or built in radiation), they
take tens of milliseconds to settle down after they've turned off, etc.
So the discharge speed is a pretty loose spec.

Scanning the scope photo of a 7 kHz oscillation and feeding it into
The Gimp (Linux's equivalent of Photoshop), it looks like the fall time
of the sawtooth is about 30 microseconds, out of a total cycle of 140
microseconds. (A 4.7 meg resistor, a 50 pF cap, and an 5AB (a tight spec
NE-2), at 140 volts). Even using just the steepest part, it doesn't look
like there would be harmonics there much higher than 100-200 kHz. High
impedance makes the waveform pretty squishy.

All the software is gone--damaged by two many years of garage and
basement storage, and I finally got up the courage to discard the
remains.

Also, the "hard-sector" disks these things used are not as easy to find.
I actually have some old Wintel boxes with soft-sector drives.

My H89 drive is not actually missing--it is "out-of-alignment"
and I don't have the tools to fix that.

There's anyway no particular value to me any more in running
HDOS or CP/M. It's been too long--I grew accustomed to AmigaDOS,
and then to MacOS 9, and now Mac OS X (with Solaris, Linux, and
FreeBSD for off-loading non-user-interface tasks)

Hey, an alternate idea: Anyone in northeast Indiana want to bring
over a serial terminal long enough to reinstall and configure Solaris
and Kubuntu, and take what's left of the Heathkit as my inadequate
"thank you" ?   :-)

Hmmm. That's probably correct! In fact, if I recall correctly,
there are both DCE and DTE connectors on the back.

Thanks, I will definitely look into that!

> You've got some vintage hardware there ;-)

Just call me cheap. The vast majority of the computers
I've had cost less than fifty dollars each.

I don't see the problem. I throw away the TV's at home (all at least
fifteen years old now), my family's collective IQ goes up 50 or 60
points. Sounds like a win-win situation for me!

Tim.

Hi
I Have successfully completed a DDS with the following facilities. It
uses Mcrocontroller PIC16F877A and AD 9850/9851 DDS chip. The main
facility in this DDS VFO is any settings including chip type and DDS
clock can be changed even after programming the Microcontroller CHIP.
Please click on the link below for more details.

http://hamradioindia.org/forums/viewtopic.php?=&p=2428

Here is some details.

1) DUAL VFO, that is VFO A, VFO B and A=B facilities.

2) UP to 50 RX frequency storage on MEMORY.

3) The Software allows 2 modes of operation,

a) VFO MODE, where the encoder is used to adjust the frequency.

While in this mode, VFO A or B is displayed on the top line of the LCD.

b) MEMORY MODE, where the encoder is used to select a previously saved frequency. While in this mode, MEM is displayed on the top line of the LCD.

4) KEYPAD Frequency entry and additional 7 Press buttons for other functions.

The remaining Functions included in the KEYPAD itself.

5) UP/DOWN fast search in three different steps using KEYPAD which is user selective.

6) SCAN and quick UP/DOWN search in three different steps with auto Repeat on PTT.

7) Frequencies are entered in MHz, the * is used to enter a decimal point,

and the # is used to ENTER the completed frequency.

If the first digit entered is the #, the number entered will be negative.

8) S- Meter reading from S0 to S9+40db in logarithmic db range.

9) Variable rate tuning to use the cheep mechanical encoder.

10) Step size can be changed from 1Hz to MHz range.

11) RIT facility.

12) VFO copy to MEMORY and from MEMORY to any VFO (A/B) facility.

13) AM/LSB/USB/CW modes Operation with PIC pin outputs for switching.

14) Allows -Ve and +Ve IF OFFESTS. Offset frequency = any value from min RX frequency to Max 999MHz

15) 10 RX BANDPASS filter selection for RX coverage from 1.5MHz to 30MHz. Usefull to set up an All band RX.

16) BAND PASS filter switching selectivity 1Hz and 1ms switching speed, which allows cross band Operation.

17) CW OFFSET adds to TX Frequency when transmitting thus avoids modulated CW.

18) Save to MEMORY and Copy from MEMORY functions.

19) Scan VFO frequency and Scan MEMORY facility

20) Time out function for ignoring any wrong entry in system settings.

21) Auto repeat function for respective keys.

22) Display Multiplier Option to use with VHF rigs

23) Menu screen allows user to change any settings in the setup screen.

24) All settings can be changed in the SETUP screen at any time even when the DDS is in working mode including DDS chip type and Reference Clock.

25) LBS/USB/CW Crystal switching (USB is treated as CW).

26) CW OFFSET adds to TX Frequency when transmitting thus avoids modulated CW.

I will be giving the software FREE along with the PCB. Interested homebrewers may Email me for Circuit and other details.

I can send the PCB anywhere in the world using Registered INDIA POST.

Hi,

The PCb have option for accomodating Coilcraft 7Pole LPF filter and
Spurious are -60db when measured.

Found some 370 volt AC (look like motor starting caps.) in several
sizes at fairly reasonable price, locally.

They would be non-electrolytic and non-polarized. In several values
between 10 and 45 mfd.

May have asked this question before; if so have forgotten the answer!
So forgive me.

But would these caps be OK as filters in the B+ of a conventional DC
power supply. Sixty hertz at 115/230 volt input. (120 hz. ripple).

Ten mfd. sound well within the range for the max. size of a filter on
the cathode output of a typical 5 volt rectifier for example A 45
would be OK after a choke input, in the second or third stage of
filtering.

Am I missing something. These are a physically slightly bigger than
'old' style electrolytics as I remember them. Probably at least two or
three times the volume of modern ones. But cap size especially in home
construction not huge issue?

Comments or contradictions welcomed. TIA Terry

The Dumb Question is What is the PCB (PolyChlorinated Biphenol)
status of these Capacitors ???
Is this why they are being dumped ???

I just got a few of these tubes and was toying with the idea of perhaps building a class A audio power amp for grins. I'd like to test them first to see if they're any good before I put forth any effort or spend more dollars. I kind of recall that the GE Notes, Hints & Tips, or whatever they were called had an article for a tester for high power tubes. Anyone recall that article or some other for a circuit to do more than a emission test?
tnx

I had some tubes and built a tester on my workbench, before I sold the tubes. The buyer wanted to know how I tested them, then bought the tubes and asked me to build a tester for him.

If you look at many of the old radio books from the 1930's, it will tell you how to build such a tester. If you have a lot of jumper wires, you can easily build one on your bench.

Simplest to start with a socket for the 211 and filament transformer. Then, you need a plate voltage and a control grid voltage. In my test case, I just grabbed stuff that caught my eye, and used 12 volts on the plate and a variable 12 volts on the control grid. Using a microammeter on the plate, I varied the grid voltage and measured the change in plate current with a change in control grid voltage, and calculated the mu of the tube, using the formula in the book.

That simple test will tell you a lot about the tube. It will not test the tube at higher voltage levels, but you can use a hi-pot tester.

The tester I built for the 211 ended up using 1000 volts for the plate and had a variable grid voltage and protection circuits. I recall I had 3 meters, measuring plate current and voltage (using a variac) and grid voltage. I recall I then made a life tester by reducing the filament voltage.

It was all in an old surplus wooden suitcase box that was polished up. Looked like something important, with laminated charts, neon lights and a leather handle.

Hi Hank,

I just got through repairing the unit. Once I analyzed the schematic, working between it and the block diagram of the PLL, I was able to label all of the stages and their functions.
The problem with my unit was that one of the connections from the bifilar wound output transormer had broken loose from its PC board connection. Once I resoldered the wire, everything started working.
The PLL is actually pretty simple; a 1MHz crystal oscillator is divided down by 2. There is some kind of step recovery circuit that gives this signal very rich harmonics. This is your comb generator.
This signal goes into one port of a mixer. The second port of this mixer has the tunable HF oscillator applied to it. This oscillator operates 4.875MHz below the expected 500kHz harmonic that you will be tuning to, thus giving a 4.875 I.F. signal at the output of this mixer.
After being amplified, the I.F. signal is applied to one input of a phase detector, while the other input receives a signal from a 4.875MHz crystal oscillator. The filtered correction signal (DC) is applied to a Varactor diode in the HF oscillator circuit to warp it on frequency if it drifts.
Now, the final part......... double tuned transformers T702 and T703 on the top board are you 4.875MHz I.F. transformers, while tht pair of T704 and C745 set the low and high frequency endpoints of the HF oscillator. In like manner, the pair of T705 and C750 are adjusted for maximum amplitude for the low and high frequency endpoints of the buffer amplifier.
I haven't figured out how to adjust T701 and C745 yet. This tuned circuit is at the output of the 500kHz comb generator.
I will hook a frequency counter, RF voltmeter, and spectrum analyzer to the LO output of the PLL later today.
The reason that it took me so many years to figure out this circuit is because of the haphazard explanation that was given in the receiver's manual. There was so much microdetail that I was unable to see the forest.

Pete

Hi Terry,

These are motor run caps and are prized by the HiFi community as filter
caps. 370VAC would be good for at least a 600V DC supply. I don't think
you'll have a problems.

Cheers,
--
Gregg

I've used that 9851 chip in past designs. Nice job on the synthesizer!

Have a quantity of Test Equipment and Radio Communications Service Manuals,
both Commercial & Amateur
Most of them are in Like New Condition.
Prices are reasonable...mailing may more than the manuals..depending where
you live!

Please check my site: www.rodemi.com for what is available.
Click on the MANUALS Heading.
I am updating the site as time allows.
I recently retired from the Commercial 2-way radio business and would like
these useful manuals to find a good home.

Thanks for looking....Norm VE3CZI

Thanks Gregg: I will check also if/whether they mention PCB as
content. They appear brand new and are in an industrial surplus
section. They don't look that old. So don't expect them to contain
PCBs any more than fluorescent ballasts less than 30 years old.

Archive-name: radio/ham-radio/recruitment
Revision: 1.1 2007/09/29 18:42:47
Posting-Frequency: posted monthly
URL: http://www.faqs.org/faqs/radio/personal-intro/

Changes followed by "|".

The rec.radio.info newsgroup, first established in 1993, has been recently revived by an active moderation team. We are currently seeking suitable information, FAQ, and bulletin articles from the entire rec.radio.* newsgroup hierarchy for simultaneous cross-posting to our newsgroup.

We are seeking a replacement maintainer for the following information bulletin formerly posted to rec.radio.amateur.* (and currently archived at http://www.faqs.org/faqs/radio/personal-intro/):

radio/personal-intro
Subject: Guide to the rec.radio Newsgroups
Maintainer: jeffreyh@Hawaii.Edu (Jeffrey Herman)
Last Posted: 9 Nov 2001 06:18:17 GMT
Posting-Frequency: 15th of each month

We are willing to provide any technical support necessary to get this article updated and automatically posted again at a regular interval. This would include establishing contact with the original maintainer for any necessary permissions. We would prefer to seek a new, dedicated maintainer at this time, rather than start auto-posting the original article ourselves.

For more information about our newsgroup, see:

http://www.panix.com/~rram/usenet/rri/index.html

Please direct any comments, questions, or criticisms to rec-radio-info-request@panix.com.

First why don't you address the spam marketing part?

Then you can simply look the word "hype" up in a dictionary. It's a
simple word with a more precise meaning than "fuzzy audio", for
example.

Hi HZ,

Individual decals as it is quite difficult to get all of the bubbles out of a large sheet. But I should have expanded. After the primer coat, the finish color is sprayed on (I use auto acrylics because they are so hard). When fully dry, this coat is wet sanded to take out any dirt and yield a better surface for the decal to adhere to. When the decals are fully dry, a clear coat is applied. After it dries, I wet sand it and this totally makes the decal edges disappear. This is then followed by a final clear coat.
Here's an example of that process:

Why on earth would you put temperature compensating components
into this product. As far as I know no other doorstop on the market
uses them.

Hello,

I have LT-2S (first model) not working properly, somebody "repair" power module and insert some odd power transistors.

There is no information on manual, which original power transistors are used, so anybody knows, please let me know.

What I found inside is: BLY87A and 2N6080???.

Thanks, Adam

Adam,

I don't have the LT-2s but I do have what I believe are the two major units inside, the TV28-144 transverter and the PA-1441 amplifier.

The PA-1441 uses a 2N6080 driver and 2N6081 final.

I've put the schematic here of you need it:

k6mhe.com/n7ws/PA1441.pdf

Hope this helps.

ps. These units are now surplus to me, so I offer them for sale for $225 USD.

Wes N7WS

Hi,
I am learning some RF knowledge. The following is a post years ago on this group. I don't understand how the last poster got -89.5 dBM. Could you tell me that? Thanks in advance.

http://groups.google.ca/group/rec.radio.amateur.homebrew/browse_thread/thread/e5d908b1b587e177/c2143f1163952dd9?hl=en&lnk=gst&q=IP3&rnum=1#c2143f1163952dd9
----
 am designing an RF stage that needs to have quite low intermodulation distorsion.

When reading data sheets for various amplifiers they usually give a figure fo IP3.

What I haven't found anywhere is if IP3 is related to the input or the output. Can ayone help me on this point?

I need ntermodulation distorsion to be at least 100 dB down at the output of
the amplifier at a level of 1.5 dBm, and I need a gain of approximately
30-40 dB.

Tomas wrote:
>Is IP3 related to the input of the amplifer.

In general, IP3 is related to the output for amplifiers and to the input for
mixers.

In the example using the Mini-Circuits amplifiers, the output 3rd order
intercept point will remain at essentially +47 dBM. With an output signal at
the +1.5 dBM level, the distortion products will be at a level of -89.5 dBM.
This is only 91 dB down from the output level and not the 100 dB desired.

In order for the distortion products to be at a level of -98.5 dBM, which is
100 dB down, the output intercept point of the last amplifier must be at
least 51.5 dBM.

A Mini-Circuits MAR-8 will make things worse because of the lower OIP.

Gain has nothing to do with these calculations. However, something to keep
in mind is that increasing gain reduces dynamic range at the high signal
level end. While an increase in noise figure reduces dynamic range at the
low signal level end.

(still me, N1JPR/I2 Filippo, different account...)

Thank you folks, lots of food for thought!

An update:

- I found 3 2SC3502 video finals in the PCB next to the tip of a CRT in a PC VDU: fT 150MHz, but low max Ic 0.1A and about 1 watt dissipation. Might be OK as oscillator or buffer, but I'm not sure it would make a good driver. I'll try it.

- Decided to try a seemingly unsuitable device, a 2SK2545 low-frequency power switching MOSFET from some industrial automation contraption, with a humongous 1300pF input capacitance.

I drove the MOSFET DC coupled (!) at 0V DC with a common-collector BD135 driver in order to swamp the base with current, and I am getting out over 2W at 10MHz at about 12 ohm measured impedance, in class C, with 12V supply.

Sounds cool considering that this MOSFET can switch 600V, handle 6A and dissipate 40W. Actually, the MOSFET indeed STAYS rather cool, while the dummy load of 3x 4 ohm 1 watt resistors get quite hot.

The common-collector driver + common-source final combination is quite promising. My next challenges are

1) Making sure that no AF,LF, VHF spurs ('cept "clean" harmonics) and clicks are generated across a range of voltages and frequencies. Now I do get strange vibes at the lower DC supply voltages, probably via the supply bus. Negative feedback seems to make a difference even in class C.

2) Reduce driver current!   For some strange reason I can't convince drivers to run in class C, neither as common drain nor as common source: even if I raise emitter voltage above base, gain drops (and the MOSFET final goes to sleep), but the driver output still seems undistorted and the driver dissipates like a stove, more so than the final...   more later when I get some proper data.

To those that advise putting tank circuits between stages: go see the many 2- or 3-transistor QRP transmitters you find in magazines, kits, etc.: putting all the filtering after the C-class final is very common. If the VFO or VXO puts out just fundamental + harmonics, then a LPF is all that's needed.

It would be cool to stitch together a 2-transistor thingie that works on 5-15 MHz, gives 2W RF at 12V and ???W when fed say 30Vdc - into a higher impedance, of course.

Stay tuned, & keep reminding me to be sane.   :-)

How well it works depends on how well you hacked the design from this
link I posted (while pointing out some of the many problems with your
earlier splatterbox):

http://www.ifwtech.co.uk/g3sek/tr-bias/tr-bias1.htm

> I was able to set set class AB bias (I chose about
>200Ma) on the power transistors... and hold +/-5% collector current
>changes from -40 to +100C heat sink temp during amp operation.

That's interesting. Previously you said your bias scheme can "hold the
500mA bias to 10% from -30 to +85C". It's funny how many times you
have changed the specs. I especially enjoyed the time when you changed
the power output specs three times in one week after you were caught
fabricating them instead of actually measuring them. Oh well, such is
the life of an internet-educated hack.

But alas, there's still one unresolved issue here, Brian.... where's
the schematic?

OK, how far did you get in the calc? If the 3rd order intercept is +47dBm, and the input is +1.5dBm, note that the TOI is 45.5dB higher than the input. For that to be the case, since 3rd order products increase in amplitude at three times the rate (in dB) as the input levels, and the input levels of the two tones used in the third order intermod test are assumed to be the same level, the distortion will be three times as far down as the two tone levels, measured from the intercept point. So for that +1.5dBm input, the third order intermod products are 3*45.5dB below the intercept point, or 2*45.5dB below the two tones.

Note that this is from an ideal model where the output y(t) is related to the input x(t) as y(t) = a*x(t) + b*x(t)^2 + c*x(t)^3. Second order products, like the second harmonic and the sum and differences between frequencies, are caused by the x^2 term, and third order products like the third harmonic and 2*f1-f2 (the usual third order intermod products) are caused by the x^3 term. But in actuality, the relationship also has higher order terms: x^4, x^5, and so forth. The x^5 term will also contribute to third-order intermod, and that causes the simple relationship of "increase the input by 1dB and the third order products go up by 3dB" to not strictly hold true. Amplifiers operated well below saturation generally conform very closely to the 3-to-1 rule, but ADCs and DACs most certainly do not, and neither do amplifiers that are driven into clipping.

Cheers,
Tom

Dale,

Does it perform as well as it looks? I am impressed and also
interested in the the case as I'm about to embark on building a
BITX20a 20m transceiver . Is it a commercial case?

Charlie.

I'm glad you're amused. But don't you think it's time for you to get a job and relieve the financial burden on your parents and the Illinois welfare system? If I lived in that state I would be outraged that you are leeching my hard-earned tax dollars, but I don't. I guess people over there prefer to coddle malingering basement-dwellers. You are certainly lucky to live in a place with such generous folks, Brian. Over here on the left coast you would have to support yourself with gainful employment. And I hope that gives you something else to laugh about, cause the thought of you actually working for your keep sure leaves -me- ROTFLMMFAO!!!

BTW, where's that schematic?

Hi,
I have a coil that is wound on a 1.125 inch diameter form and 3 inches
long space wound with 25 turns of 11 gauge aluminum wire...
I am trying to duplicate this coil only instead of using 11 gauge wire
I am using 12 gauge aluminum wire.
I was wondering if somebody could help me out and make sure my math is
right since I am unsure of how to go about making sure I match the
inductance.

I had this figured out once but mistakenly had the wrong wire
gauges...

Any help is greatly appreciated
Thank You

Back not so long ago when you posted a similar question on the antenna
newsgroup, Owen Duffy so kindly posted a url for an inductance
calculator, which I repeat here for your benefit:
http://hamwaves.com/antennas/inductance.html. It will do all the math
for you. Well, almost all. You still need to put your dimensions in
terms of millimeters, and make sure you enter the diameter of the coil
as the form diameter plus the wire diameter, so that it's the mean
coil diameter you enter.

Cheers,
Tom

I would just visually duplicate what the original looks like. It should be fairly close and you can spread or squeeze the turns to "tune" it to the inductance required.

This is the first time I've been to that link. The circuit he shows with the two transistors is similar to mine. My feeling is that his is needlessly more complex, but I'm sure it works. I also agree with his statements about the diode method used for tracking. That method works a little better than no tracking and is not worth the effort. This is because putting two diodes in parallel never works right. One always has a lower drop... and hogs.

Thanks Tom,
That calculator doesn't work for me for some reason. Every time I tried to use it,it comes up with an error.
I have tried several different calculators but get varying answerers.

Hi Scott,
If My math is right I would need 23.5 turns of 12 gauge wire to reach the same inductance as the original coil.

Sorry for what may seem like a repeat post,but for some reason I can not seem to get comfortable with coils and inductance.

Thank You

I'm looking for an instrument case for the BITX20A 20m transceiver, the choices in the regular UK outlets don't look too special. What I'm looking for is something around 6 inches wide, 8 deep and around 3 inches high (150 x 200 x 70 approx). Something with extruded sides would fit the bill but it has to be all metal.

I'd appreciate any URLs of suppliers in the UK or US, meanwhile back to googling :)

Thanks,

Charlie.

C -

I am going to use an old modem case (hopefully).
Hundreds of thousands of analog modems at retail office / stores across
world have hit the trash heap in past 20 years. Some are all plastic, but I
have retrieved one that may work for my future BIT20A kit.

Charlie, at the next boot sale coming near you, look for the A/B switch boxes for switching between printers and serial ports and the like. Some are roughly the size you're asking about and you just have to make a new front and rear panel for them. (They ARE steel, and a bear to work with) As an alternative, I have some extruded Aluminum boxes 1/8 th inch wall that are 6 wide by 8 deep by 1-3/4 high. Open front and back but internal ribs for sliding in a couple PC boards and tapped on the ends for 4-40 bolts for holding on front and rear panels. If you can live with the reduced height, one is yours for the postage.

Personally, I run a speech compressor. I doubt many of these idiots
could install one; apparently, they can't afford to have the local "cb
tweak" install if for them either.

Local, I kill the speech compressor, it is only for DX. Frankly, it
doesn't hurt my feelings they don't have one! <evil grin>

Keep up the sales pitch--few will be disappointed if they purchase one ...

Regards,
JS

I just ran the calculator at the referenced web site. It suggests that you will have a hard time telling the difference between 25 turns of 11AWG and 25 turns of 12AWG, wound on the same form and to the same net length. The calc for the 12AWG shows inductance about 0.3% higher than for the 11AWG. I'd have guessed it would be slightly lower. The SRF's and Q's are similarly close, by that calc.

My feeling is that you are worrying the problem to death...

Cheers,
Tom

===============================

Charlie , I have seen (simple) aluminium enclosures of the approx size
you need at Maplin (Inverness). Including one with a black plasticised
cover. You can finish those yourself with Hammarite paint from a spray can.

Good luck with homebrewing the BITX20A

Get a free TV with no credit card. Follow this link and sign up where
it says Start Here. Then sign up for an offer I recommend ebay (or
FastWeb if it works on your computer) because you don't need to give
them your credit card # or pay anything. If you choose ebay create a
new account and bid 99 cents on something very expensive like an
iphone or ps3 so you are guaranteed to lose.

Yeah, bullshit. I've posted it four times over the years, and I'm sure
you've run across it in your quest for hackable designs.

> The circuit he shows
>with the two transistors is similar to mine.

Gee, what a suprise.

Yet you used it in your previous amps. You even defended the design,
which is when I posted the link above. It wasn't long afterwards that
you came up with your last hack job.

> This is
>because putting two diodes in parallel never works right. One always
>has a lower drop... and hogs.

I don't see two diodes in parallel. Time to lay off the sauce, Brian.

Frank... I didn't say the diode scheme didn't work... I said it didn't
work well. Actaually, the Motorola RF Data Manual shows this scheme in
many of their designs... so maybe you give them a call and let them
know how foolish they are... lol
But seriously, the diode thing isn't worth the trouble unless you are
willing to hand-select components that go alaong with that circuit.
Even then, it's certainly not the best method. By the way... the diode
tracking scheme does try and use two diodes in parallel. Sorry you
don't see that... but that's how it is... and why it doesn't work
well.

So long as the new coil is wound at the same pitch as the old coil
the inductance will be the same.  Since you want to use a higher
gauge wire (thiner) this will be easy to do.  The pitch, is of course,
the number of turns per inch.  So if the old coil was close wound, the
new coil will be slightly space wound (air spacing between each turn of
wire).

It's worth adding that the size of the wire is often specified because either that's what fits on the coil form (ie if you need X number of turns, a bigger guage won't allow that number of turns in the space) or because there is reason for using heavier guage (such as because it's carrying higher current, or you want it self-supporting).

Coils don't exist by themselves. To serve a purpose, they are associated with capacitance, and that capacitance will allow for adjustment, and may even require adjustment even for a "perfect coil" since there will stray capacitance from the circuitry that never shows up in a schematic, and stray capacitance from the coil itself.

Michael

Frank,

I've looked at the aluminium boxes which look great for most projects but I want something a bit stronger and professional looking for the transceiver. Maplin also sell the Hammond range of enclosures but their biggest is too small. Since posting I have found a bigger range of the same style at Rapid Electronics and I may go for one of these.

I'm pretty excited about building the BITX20A, my plan is to use an
LCD display using a 10 turn pot/varicap diode instead of a tuning
cap and I aim to bring the cost in at under �100.

Charlie.

Harold,

I know the steel boxes you refer to, similar new ones are quite cheap in the UK. Thank you very much for your kind offer! I think that your box would be hard to work with as the height is much the same as the LCD counter I want to use! In fact I have located some enclosures very similar to the ones you have.

Thanks again!

Charlie.

No problem Charlie, and wish you well in your search. The length and width of these were exactly your specs and I have, after seeing someone else do a similar trick with a A/B box, slit the two sides and expanded the height with nothing more than a pair of pieces of Aluminum to bolt top and bottom together. The 1/8 inch wall allows countersinking the bolts and looks quite professional.

gb,

Thanks for responding, that's a good idea for homebrewing. I think
that I have found what I want at a reasonable price.
(see http://www.hammondmfg.com/1455.htm)

==========================

Charlie , When replacing a variable aircap by a 10turn potmeter +
varicap , I would suggest you pay much attention to the stabilised
voltage feeding the potmeter/varicap ,to ensure acceptable frequency
stability

Better yet, the counter already has 95 percent of what's required for a Huff
n Puff stabilizer. Add that and the rig will stay put for months.

Charlie, my boxes are the same external dimensions as that 1455T2201.

Regards
W4ZCB

Charlie

I don't know how things are in merrie auld England, but here in the colonies, a brake and shear is surprisingly affordable. With a little up front investment, you can have exactly the right case for every project.

Low priced U.S. suppliers are folks like Northern Tool, Harbor Freight, etc. I don't think I would try shipping one from here, though. They tend to be kinda heavy, but there must be some U.K. equivalent supplier.

Hi guys!
Am still going over the old TS-820 and found another problem re the
meter. It is important when replacing the meter to check the condition
of the multiplying resistors on the underchassis "HT" board and adjust
to suit the actual sensitivity of the meter.
Mine was reading 730 volts off load for final anode voltage but my
trusty old Avometer tells me that it was actually 1,040 volts.
Now this is WAY above the recommended anode voltage for even a 6146B
but since the tansformer secondary is 800 volts its probably correct.
I've now got the voltage reading correctly on the meter, but I'm now
very convinced that the reason for flashover in some 6146's is simply
excessive HT voltage. The finals are running in very dangerous
territory. Just a bit of SWR then Poof!!!
I'm now considering modifying the case and using a TT21 as a final.
These can stand the voltage with ease, are very easy to neutralise
and can give a good 65% efficiency in AB1 up to 30 Mhz. Will give me
around 80 watts out I reckon.
Just that my final box will be a bit taller and the old case will need a
bit of chopping about.
But then its an old rig and it might as well work properly, even
modified. Anyone elese tried major final tube changes in the Kenwood
hybrids?
Regards Cliff Wright ZL1BDA ex G3NIA.

Thanks Tom,
I went ahead and wound the new coil with the same amount(25)of turns
as the original and will go from there. Like you mentioned I think I
am over worrying it.
I have a Grid Dip meter I have been meaning to learn how to use so
maybe I will try and learn on this coil...

As for the inductance calculator,I have no idea why it never works for
me? Every time I have tried to use it,it gives me an error?

Hi Ken,
I am assuming that the new coil is going to be wound at the same pitch
as the original as the form its wound on has spiraled groves in it
that the wire sits in.

Hi Michael,
The coil is actually part of a trap on a 3 element tri-band beam that

handles full legal limit power.
so I am guessing that the slight change in wire(from 11 to 12
gauge)wont hurt anything.

Can any of you suggest a good book on coils,that includes theory,math
and all that good stuff?

I Appreciate all the help and Patience everyone
Thank You

You're kidding me right?... the external tracking diode (one) and the
base-emitter diode of the power transistor (two). Got it?

=========================

Cliff , Does the TS-820 HV transformer have just 1 HV output or is there
also a lower voltage tapping.
I recall that the early Yaesu FT400/500 series (valve)transceivers had a
transformer with 600 and 850 V tappings.
The TV line sweep valves (tubes) in the PA worked well with the lower
voltage .....but 850V was toooo much especially when you used the PI
tank for matching the antenna (no external matching unit)
I used an old 1970 era FT-400 that way as my first TRX from 1985 - 1989.

Hi Denny & Larry,

I'm aware of the large amp's used on 27MHz and have a heavily modified 16 device 14v CB amp in my collection with a proper bias circuit for SSB operation. However, it's still only suitable for 10 through 15m in it's present configuration.

I took my blinkers off around 84 when I was in the states and drove non-stop from one 'shootout' in Tyler TX to another in the Windy City!

Larry, My HF mobile vehicle runs an early turbo diesel engine and was built before engine management systems were introduced. Heck, being diesel there's not even a traditional ignition circuit to interfere with. Receive's also nice and quiet:-)

So, without increasing PA voltage it seems one's still stuck with a bunch of bi-polars. How technology has move on in 25 years - not.

Phil G4ZOW

I built a new first mixer for my old rx last night and installed it. The old one used a single transistor, I am not sure what it was but the new one uses a pair of FETs in a balanced circuit. You wouldnt believe the improvement. Now I know why I put this thing in the back of the closet about 15 years ago. I was going to rebuild the whole radio modernizing it but I may stop with this.

Jimmie

Why are you knocking this product? Did you purchase one of these units and
have you tried to use it or do you just have something against Telstar and
you like to bitch??

I am not involved with nor have any monetary investments with Telstar!

>From the kangaus.com website:

"Findlay Ohio was hit by massive flooding about a week ago. We were one of the lucky ones - we only had water up to the ceiling in the basement. Others lost a lot more. All the Kanga US equipment and inventory (except the DK9SQ masts - they were in the garage) has been lost. We have spent the past three days just emptying the rubble from our basement, and probably have another two days to go just to get everything out. The we will have to tear out the walls and ceiling and begin the cleanup and repair. I have no idea how long that will take. After that is done I will be able to accept orders for masts only, and I will have to decide what to do about the future of Kanga US. If anyone has submitted an order or is waiting on a shipment, I will have to provide a refund - there is just nothing available to ship. It will be at least three weeks before I will be able to take care of any issues..."

First and most importantly, let's take a minute for solidarity in this time of need. Second, however - where can we get a hold of Rick Campbell's R2/etc receiver kits!?

73,
Ross

Lisa And Ed Show #4

http://www.evoca.com/LisaAndEd/LisaEd

&

http://www.myspace.com/Lisa_And_Ed

On show #4 Lisa and I talk about the Meth epidemic that plagues the United States, through poetry and discussion. The following poems were recited:

Tina

Put to death my former self,
from poisons I consider wealth.
That take away, from all my pain,
and eat away my fragile brain.
And sleeps become a bitter chore,
So night is now my wicked whore.
She keeps me hidden out of sight,
away from all the blessed light.
And I no longer have a choice,
for Tina's now my only voice.
She tells me how I should feel,
she never lets my body heel.
And I would crawl across the floor,
for the chance to get just a little more.
And I'll play my hand
for the cards are dealt,
until I've joined my former self!

Meth

Brain patterns of new.
Scares embedded into your mind.
Not sure if your you.
Not sure of your place or your time.
See shadows that move.
Everything is coming alive.
Not even a clue.
Not even trusting your own eyes.

Blisters on your tongue.
You fear the sun.
Liquids that you crave,
Are flushed away.
Kingdom come has come.

Your hearts a drum.
Running up the days.
For rest you prey.

Thin blue avenues.
Antifreeze is flowing inside.
Don't know your next move.
Don't know if you will even try
Nightmares have come true.
Dr. Jeckle's now Mr. Hyde
Don't know what to do.
Don't know if you will live or die.

Leather for your skin.
Your souls worn thin.
Trying to avoid.
The inner void.
Where did I begin.
This life of sin.
Am I just annoyed
Or paranoid

Ed~xxxx

Underneath the flesh
Vacant is the hole
No need to confess
Its out of our control
Just beyond the noble rot
though bitter be thy name
You help me find what I forgot
kept hidden from the pain
And though distance smiles arriving
Get caught up inside black clouds
I know that we're surviving
Like silver lining kept in ancient shrouds
And all that I need to triumph
Is the gentle voice that you provide
And together we'll rely on
A kind of love that's lost with pride
Now I look forward to the future
And all the comfort that it brings
Though fresh with blood stained suture
I have finally found my wings.

Tame less

She's a colorful bouquet of splendor,
Many lives that fall apart,
And come together.
Her cries echo from empty bottles,

Through love, and fear,
And rage, and lust.
A plaything betrayed,
By all she trusts.
Her hand and heart are objects,
Of feverish pursuit.
Possessed by no man,
My desperation is mirrored
In her lonely eyes.
She will not be tamed
This lovely, wild creature.

(Spoken word internet radio)

Have a quantity of Test Equipment and Radio Communications Service Manuals,

both Commercial & Amateur
Most of them are in Like New Condition.
Prices are reasonable...mailing may more than the manuals..depending where you live!

Please check my site: www.rodemi.com   for what is available.
Click on the MANUALS Heading.
I am updating the site as time allows.
I recently retired from the Commercial 2-way radio business and would like these useful manuals to find a good home.

Thanks for looking....Norm VE3CZI

What the heck is a CWS - 1. I picked up one this weekend and it looks fairly butchered. I got it for parts. Looks like a transceiver and I am guessing it used a pair of 6146s in the final.

Jimmie

Reminds me of a phono oscillator I built as a teenager out of old TV and
radio parts.  Had a 6F6G oscillator modulated by another 6F6 coupled by
an old TV filter choke.  The oscillator coil was wound around a
cardboard tube from a roll of toilet paper.  With 300 volts on the
plate, It had a range of a few city blocks.

Finding a plate modulation transformer may be the hardest part. They
have always been expensive.

Cathode modulation is my next choice with grid modulation as a last
resort.

The most practical approach (someone else mentioned this) would be Heising modulation. The modulator 811 would be, like, in parallel with the RF amp 811 and both fed with DC through a fairly big choke (10 Henry or more). There has to be a dropping resistor that eats up some of the DC voltage going to the 811 RF amp, and you'll need many watts (5+?) of audio to drive the grid of the 811 modulator.

Modulation transformers are still made by Peter Dahl (?) in Elpasso, Texas, and will be several hundred bucks at least. I think I have never seen a single ended modulator circuit unless it was for very low power.

Of course, Heising is single-ended. In normal Heising, the choke must handle the DC current of the PA and the modulator, and not saturate in the process. By using instead a center-tapped winding you can (nearly) balance the DC, so the choke saturation isn't so much a problem. If you use an audio output transformer for the job, say 4000 ohms CT to 8 ohms, that's an 11:1 turns ratio from half the primary to the secondary, and you can add the secondary to the PA side to get a little higher (a little closer to 100%) modulation. Not that audio output transformers of an appropriate size are a dime a dozen, but there's at least some hope of finding one "kicking around" somewhere.

Or--maybe you can find someone taking an old plate-modulated AM broadcast transmitter out of service and get a really good set of modulation transformer, modulation choke, and coupling capacitor. ;-)

Tom

August 1956 QST has a class B modulator that works without a modulation transformer! Two tubes, which goes against the original posters question, but what the hay. If you don't have to buy the transformer, you can afford the second tube.

Still looking for my class B/A article on the 304TL Heising bias shift modulator. Am certain that the author was Bill Orr, W6SAI, cause I called him on the phone when my 304TH didn't work as advertised. Very nice and helpful to an almost beginner, but that article doesn't exist in any QST to back before I would have read it. As I now recall, I think maybe Bill wrote it up in CQ magazine and got paid for it. Don't have those on CD's.

Regards
W4ZCB

Anyone have a scan [pdf or other] of a B&K 1460 OSCILLOSCOPE manual
they could send me?

Thank in advance,
Joseph

```

Human natures are fine tuned for gene pool survival.

The way we evolve in the gene pool is that when we're not at war, we're in a race.

Peace and freedom means competition. Some people are uncompetitive. So they don't want to compete. Those people demand slavery.More...

Those who demand slavery are not necessarily poorer or richer, superior or inferior. Those are people that somehow do not like competition.

The farm owning farmers in southern US, for example, do not want to compete with the higher salary the industrial north has, so they demand slavery. This happens despite the fact that the landlords are already way richer than their slaves.

Uncompetitive businesses also do not want customers to be free to choose the best products. They demand enslavements of consumers by restricting consumers choice to choose better products.

As time goes by and consensual productive means to aquire wealth become available, those who oppose competition tends to be the one inferior.

When we're not at war, we're in a race. So in a sense, some part of life is a zero-sum game. The happiness of some superior competitors correlate with gene pool survival of such people. This correlate with the extinction of inferior people and this make inferior people unhappy....page...

For example, women prefer rich smart males and normal males prefer as many females as possible. Actually poor males prefer more money rather than more women, but that's later.

If rich smart males get more females, then rich smart alpha males will survive better in the gene pool. That means, the other males do not get any. Hence, the lesser males will not be happy. They will then come up with monogamy to ration females in equal share for everyone.

Those who are uncompetitive are not going to say honestly that they are disgruntled competitors. They're going to come up with some religious unscientific fairy tales to come up with pretext that freedom, such as free sex is wrong.

In short, whenever someone is happy, whenever something gives pleasure, happiness, and money, you can count that someone, somewhere, somehow, will come up with some fairy tales of who knows what that somehow it's wrong, bad, and should be prohibited.

The preference to snuff of happiness earned by others are called envy. In a sense, those who want to be happy are meant to kill each other with those who are envious.

Unless those who run the fastest also hit the hardest, success is simply a bridge to a gas chamber. Deviation from free fair competition turns life into some form of gun fight.

Not everyone can be appeased in a gun fight. Envy is simply unappeasable. The way to keep pursuing our happiness and still be alive is either to kill, or threaten to kill, those who are envious of us that it's not to their best interests to kill or prosecute us....page...

That's why I strongly support death penalty. Without it, all succesful people will be slaughtered by bigots that don't mind going to jail for it.

It's also the same reason why many ugly women oppose porn. That's because those women are envy bigots.

Think of it this way. Pretty women can just show some skin and make millions of dollars. Ugly women has to sexually serve poor males and get knocked up for much less money.

If this keeps going, pretty women can pick the best males with the best genes and provide their sons with better education, opportunity, and more initial start up capital.

The pretty genes will survive better in the gene pool and the ugly will be outcompeted, like in Europe or Japan. All thanks to porn.

Obviously, pretty porn stars are way better of then ugly wife. Becoming a porn star or prostitute is then one of the best job ever in this world.

However, out of envy, ugly women will want to prevent that. What's their justification? By saying that all the good jobs are so bad that it can't possibly consensual, and hence has to be prohibited.

They said that porn should be prohibited to protect women. Which women? Not the consenting one of course. How in the earth people get protected from consensual offers anyway. It's there to protect disgruntled envy competitors.

With one audio amplifier tube you'll have to run in class A. A class A amplifier always has the same current flowing into it. With no audio applied all that power gets burned up in the tube; at maximum output (with a sine wave) 1/2 of the power goes to the output.

So the best audio power you'd get would be 1/2 the dissipation of the tube. IIRC an 811 is only good for 65 watts, so you're talking 32 watts of audio, which isn't much.

With two tubes in push-pull you can run class AB. A class AB amplifier has significantly less standing current, and consumes more as the power output goes up. Not only could you get significantly more sinusoidal power out of the amp without burning up the tubes, if you want to push things a little bit you can take advantage of the fact that the tubes will only dissipate heat when you're making noise. Taking that into account a pair of 811's will (IIRC -- check up on this) be good for something between 120 to 200 watts.

Or you can just run a PA amplifier from the Rat Shack into a step-up transformer...

I understand that the answer to the basic question is 'no'; not
necessarily push pull for an audio modulator. Just a big hefty audio
amp and some means of plate modulating the RF PA! There are other
methods of AM modulation etc.

BTW the 6146 design above sounds ingenious; have a mental picture of
the total DC plate currents divided in opposite directions one for the
RF tube and the other for the modulator tube. Then I suppose the
modulator tube as it received audio, varied the plate voltage/current
of the RF tube thus modulating it. A sort of variation of Heising
(choke) modulation? Interesting.

Screen grid modualtion it it was a tetrode PA! But the 811 is a triode
I think?

'bama.sbc.edu' has limited bandwidth and limited number of simultaneous
connections.  edebris is a mirror of BAMA with much higher bandwidth and no
limit on connections.
